Topological recursion:
computing asymptotics of
knot invariants like counting maps ?

1 Maps with(out) tubes ...

2 ... and formal matrix models

3 Introduction to knot invariants $W(G, R)$

4 Torus knots and $W(G, R)$

5 Hyperbolic knots and $W(G, R)$

1 Maps with(out) tubes ...

Definition

Planar maps and substitution

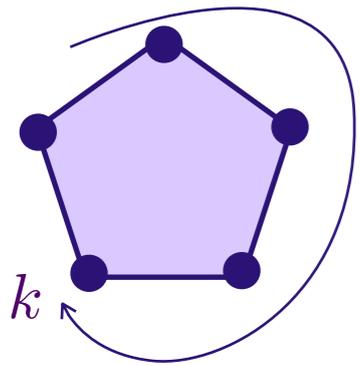

Planar 1-cut lemma

Higher topologies

1. Maps with(out) tubes

Definition of a map

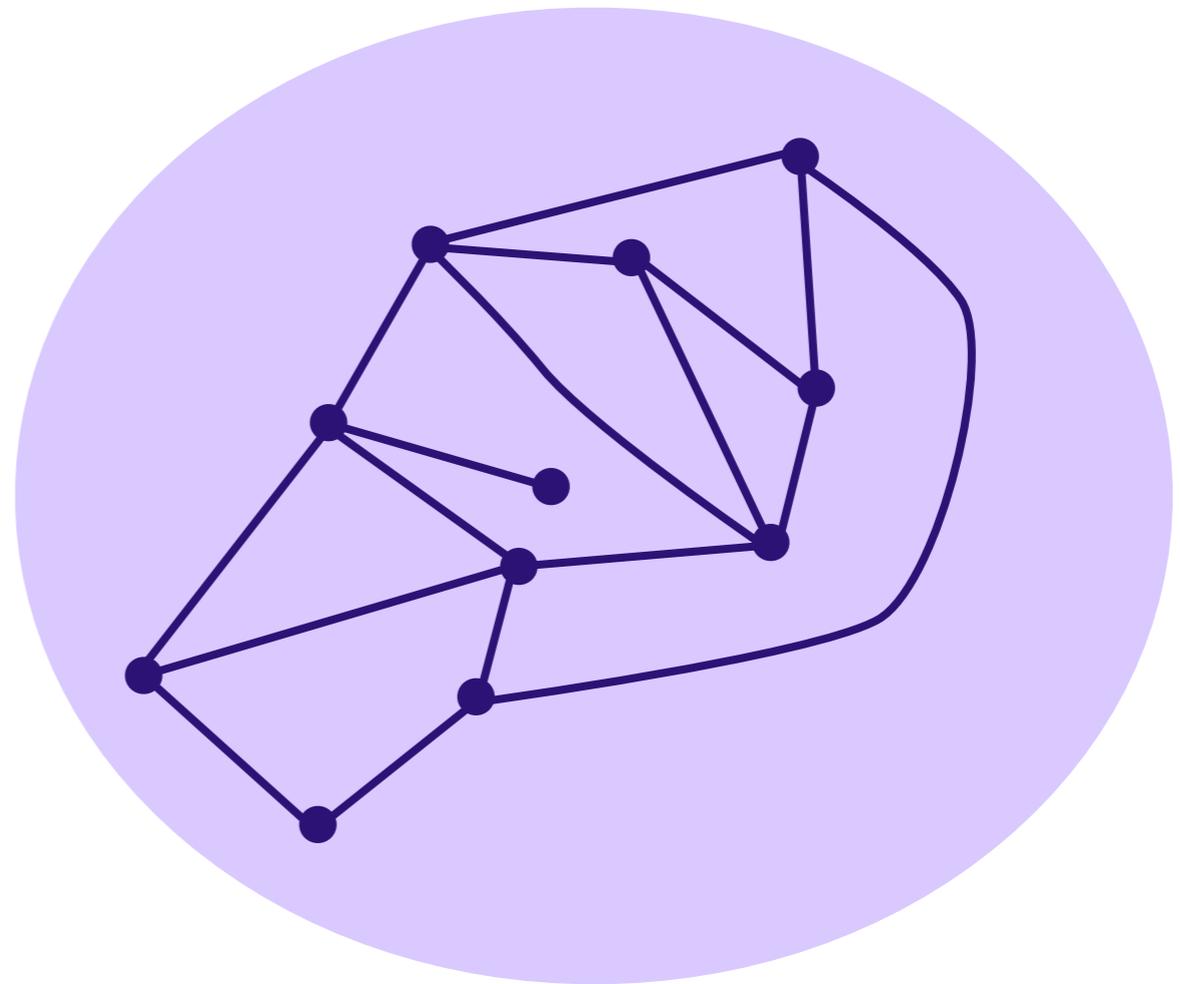

A **map** is a discrete surface obtained by gluing along edges faces with topology of a disk

weight
 t_k
($k \geq 1$)

weight
per vertex
 t

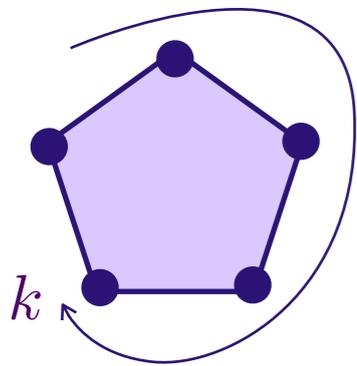

$$\text{weight} = t^{11} t_3^3 t_4^2 t_5 t_6^2$$

1. Maps with(out) tubes

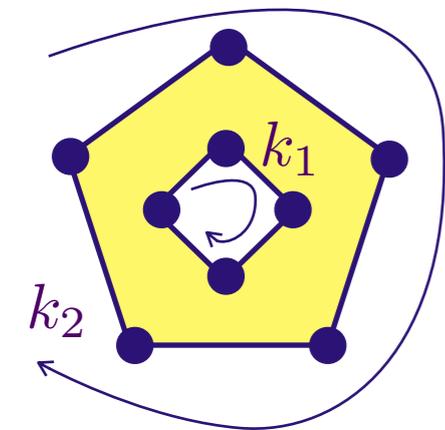

Definition of a map with tubes

A map with tubes is a discrete surface obtained by gluing along edges faces with topology of a disk

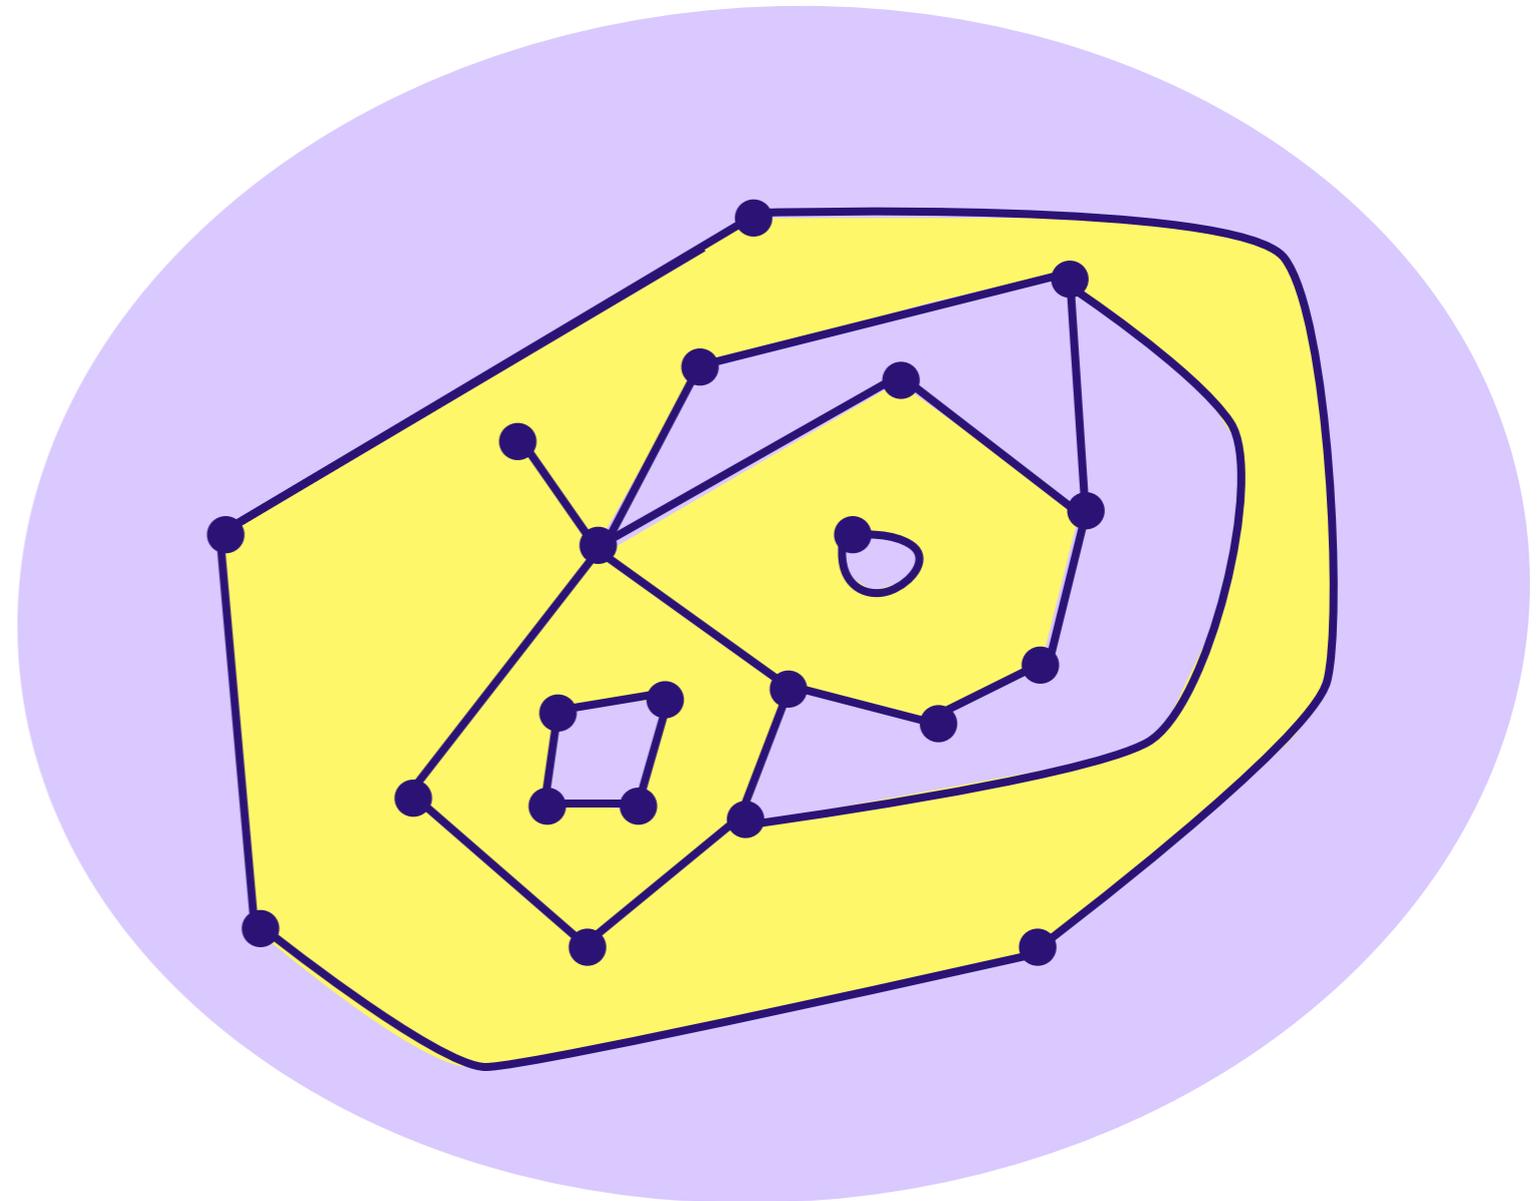

weight
 t_k
 $(k \geq 1)$

or with topology of a cylinder

weight
 $\gamma t_{k_1, k_2}$
 $(k_1 + k_2 \geq 1)$

- weight t per vertex

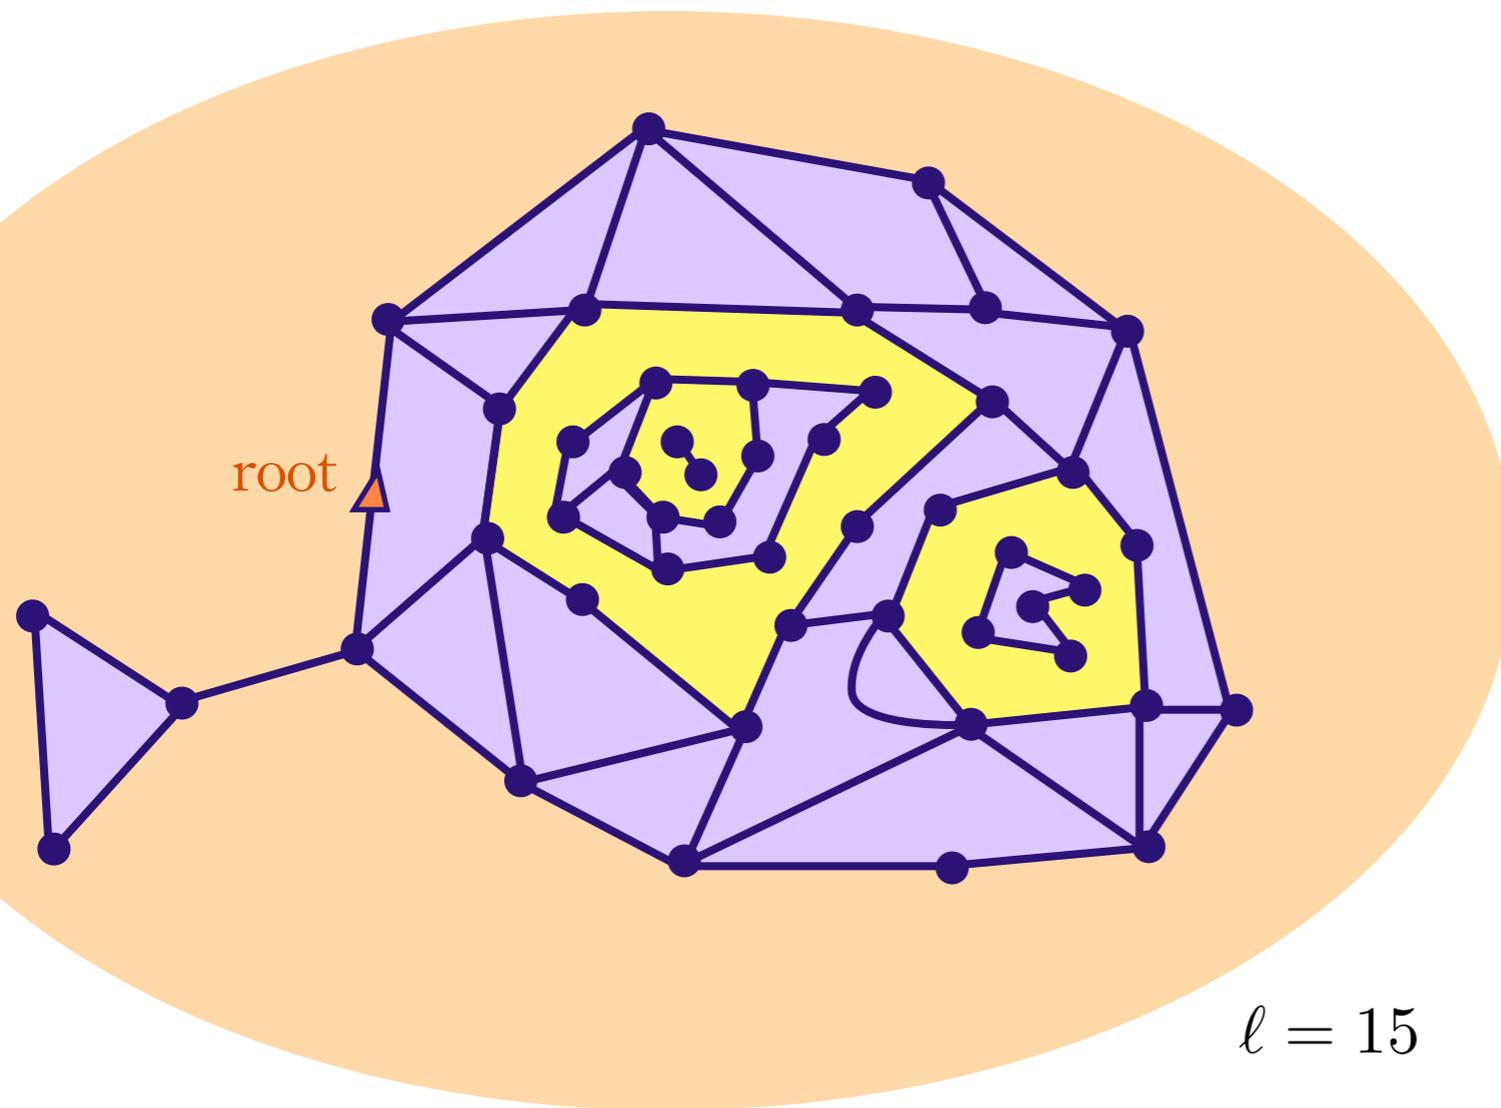

$$\text{weight} = t^{22} \gamma^3 t_1 t_4^2 t_5 t_6 t_{4,8} t_{4,5} t_{6,1}$$

1. Maps with(out) tubes

Planar maps and substitution

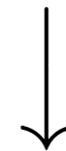

Planar maps are those which can be embedded in a sphere.

$T_\ell[(t_k)_k; (t_{k_1, k_2})_{k_1, k_2}]$ = generating series of maps
with **1 marked, rooted face** of perimeter ℓ

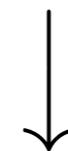

$\ell = 15$

Planar

Notion of
inside/outside a tube

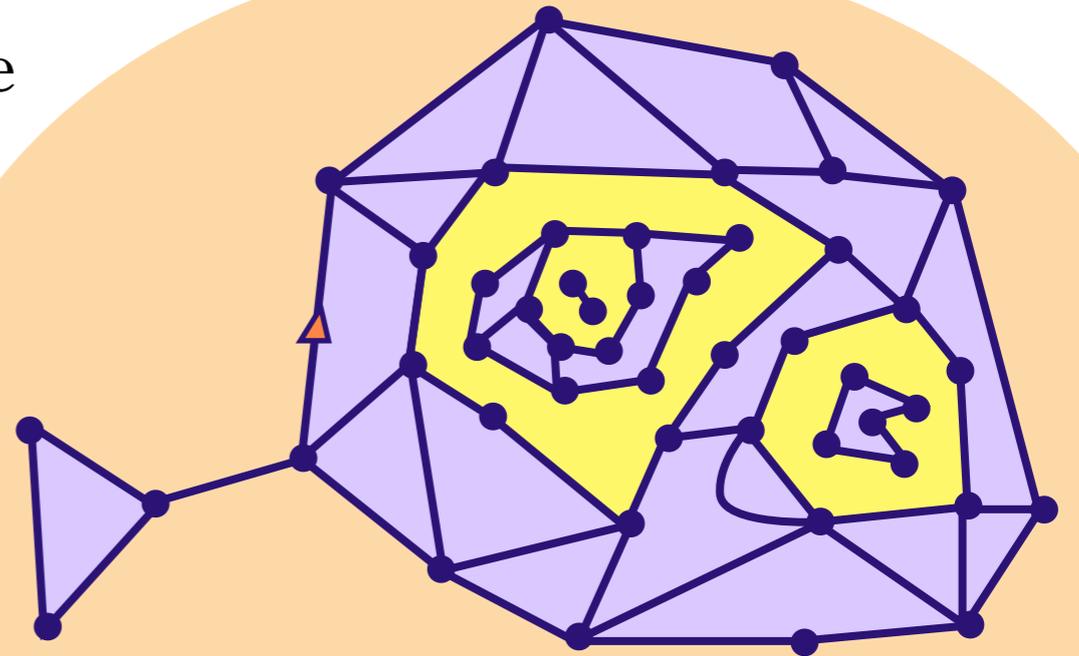

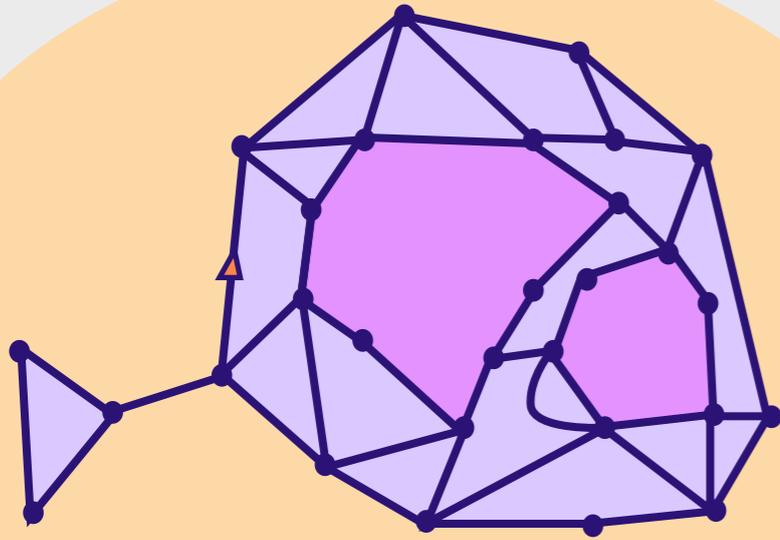

Planar maps with tubes
have a nested structure

1. Maps with(out) tubes

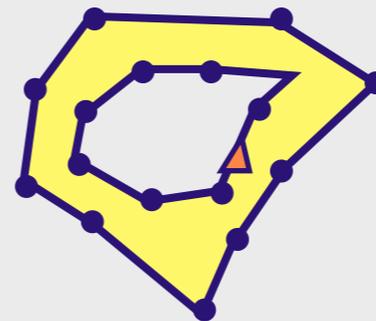

Planar maps and substitution

Planar maps with tubes have a nested structure

map with **large faces** (gasket)

with substitution of tubes (rooted inside)

stuffed with rooted maps with tubes

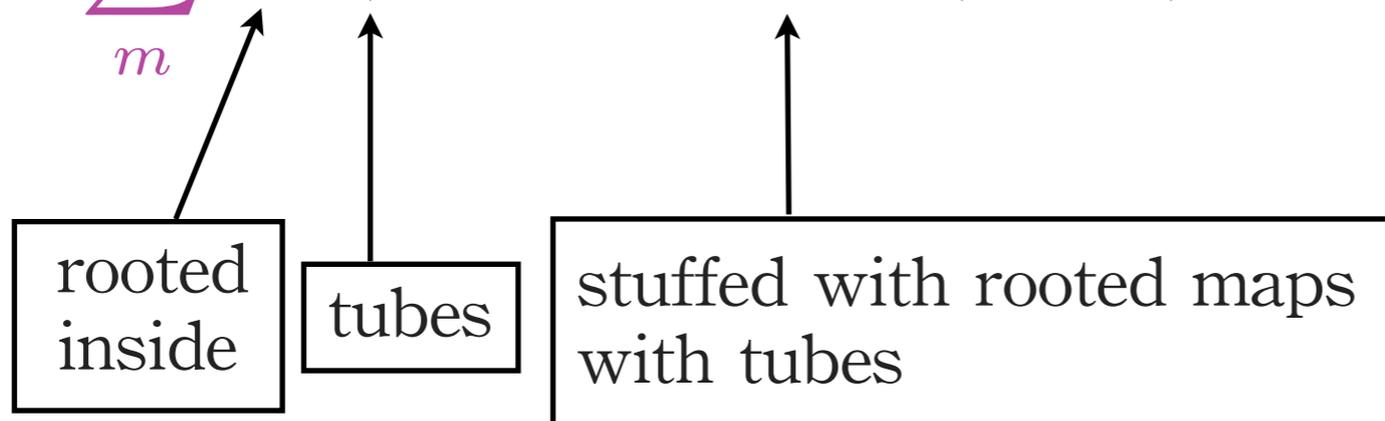

Planar maps with tubes have a nested structure

$$T_\ell[(t_k)_k; (t_{k_1, k_2})_{k_1, k_2}] = T_\ell[(\tilde{t}_k)_k; 0]$$

with substitution of

$$\tilde{t}_k = t_k + \gamma \sum_m m t_{k,m} T_m[(t_n)_n; (t_{n_1, n_2})_{n_1, n_2}]$$

→ Counting planar maps with tubes is reduced to counting planar maps

Definitions

$t, (t_k)_k$ non-negative is admissible when $\forall l \geq 1, t \partial_t T_l[(t_k)_k; 0] < +\infty$
(generating series of pointed rooted planar maps)

$t, (t_k)_k$ real-valued is admissible when $|t|, (|t_k|)_k$ is admissible

$t, (t_k)_k, \gamma, t_{k_1, k_2}$ is admissible when $t, (\tilde{t}_k)_k$ is admissible

Definitions

$t, (t_k)_k$ non-negative is admissible when $\forall l \geq 1, t \partial_t T_l[(t_k)_k; 0] < +\infty$
(generating series of pointed rooted planar maps)

$t, (t_k)_k$ real-valued is admissible when $|t|, (|t_k|)_k$ is admissible

$t, (t_k)_k, \gamma, t_{k_1, k_2}$ is admissible when $t, (\tilde{t}_k)_k$ is admissible

Planar 1-cut lemma

Bousquet-Mélou (02), GB, Bouttier, Guitter (12)

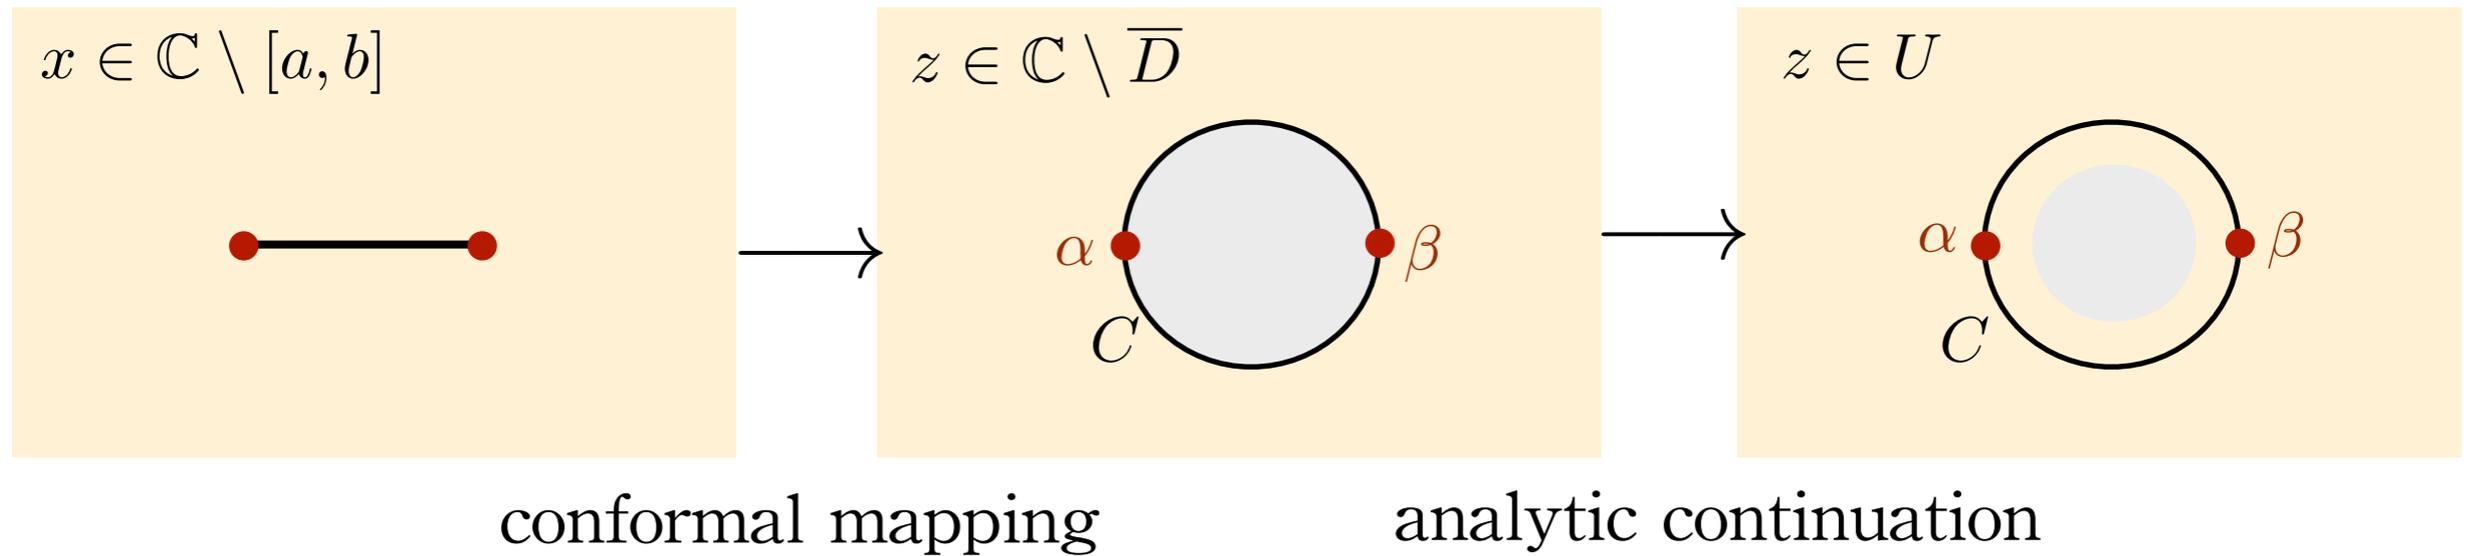

If $t, (t_k)_k, \gamma, t_{k_1, k_2}$ is admissible, there exists $a, b \in \mathbb{R}$

so that $W_1^0(x) = \left(\frac{t}{x} + \sum_{\ell \geq 1} \frac{T_\ell[(t_k)_k; (t_{k_1, k_2})_{k_1, k_2}]}{x^{\ell+1}} \right) dx$

- * is holomorphic in $\mathbb{C} \setminus [a, b]$
- * has a discontinuity on $]a, b[$
- * remains bounded

1. Maps with(out) tubes

Analytic continuation

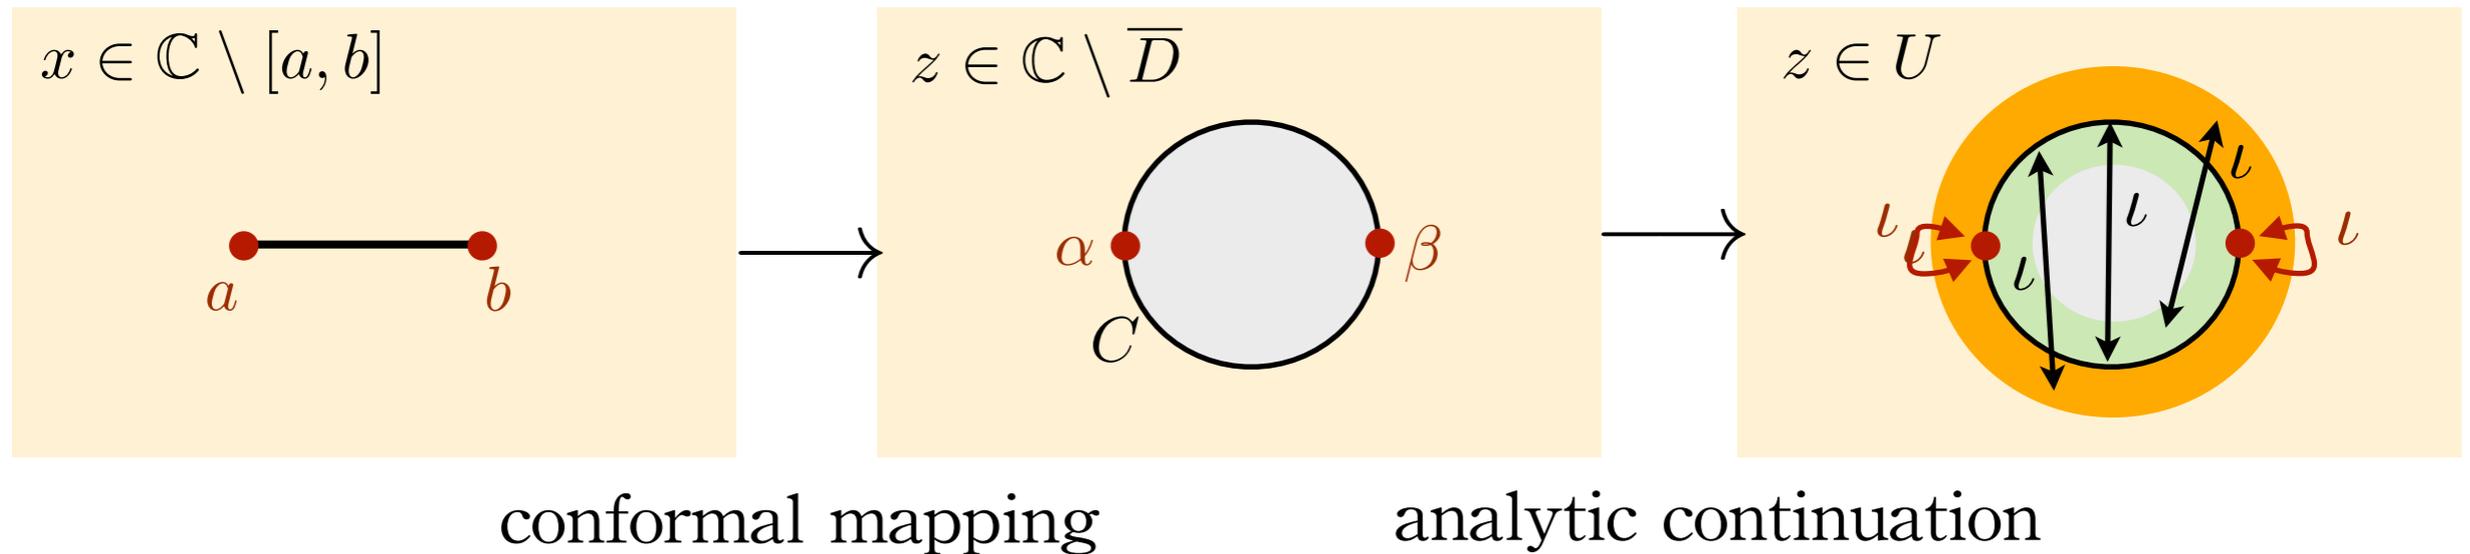

Fact

$\omega_1^0(z) = W_1^0(x(z))$ can be continued in a neighborhood U of C

1. Maps with(out) tubes

Analytic continuation

Fact

$\omega_1^0(z) = W_1^0(x(z))$ can be continued in a neighborhood U of C

We have an involution $z \mapsto \iota(z)$ so that $x(z) = x(\iota(z))$ exchanging interior/exterior of C

$W_1^0(x)$

determines a Riemann surface, called **spectral curve** on which it can be seen as an analytic 1-form

A map with(out) tubes has **genus g** if it is connected and can be embedded in

We define the generating series

$$W_n^g(x_1, \dots, x_n) = \sum_{\ell_1, \dots, \ell_n \geq 1} \left[\prod_{i=1}^n \frac{dx_i}{x_i^{\ell_i+1}} \right] \times \left\{ \begin{array}{l} \text{generating series of genus } g \text{ maps} \\ \text{with rooted marked faces} \\ \text{of perimeters } \ell_1, \dots, \ell_n \end{array} \right\}$$

and we would like to compute them ...

We cannot speak of nesting for $g > 0$!

Rather use Tutte bijective decomposition of maps to establish functional relations
+ a good deal of complex analysis ...

$$W_n^g(x_1, \dots, x_n) = \sum_{\ell_1, \dots, \ell_n \geq 1} \left[\prod_{i=1}^n \frac{dx_i}{x_i^{\ell_i+1}} \right] \times \left\{ \begin{array}{l} \text{generating series of genus } g \text{ maps} \\ \text{with rooted marked faces} \\ \text{of perimeters } \ell_1, \dots, \ell_n \end{array} \right\}$$

1-cut lemma

If $t, (t_k)_k, \gamma, t_{k_1, k_2}$ is admissible, then $W_n^g(x_1, \dots, x_n)$

- ✱ is holomorphic in $\mathbb{C} \setminus [a, b]$
- ✱ has a discontinuity when $x_i \in [a, b]$
- ✱ can be analytically continued to $\omega_n^g(z_1, \dots, z_n)$ on the same Riemann surface

It can be computed by a recursion on $2g - 2 + n$ which takes a universal form

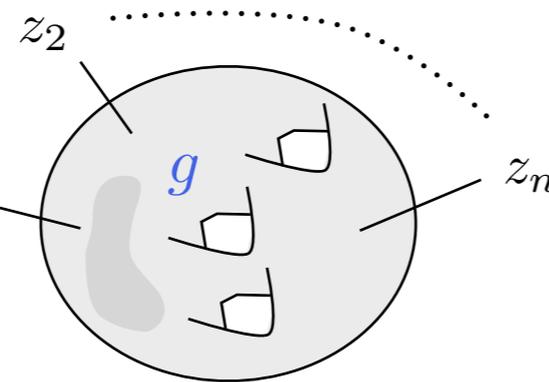

for maps Eynard (06)

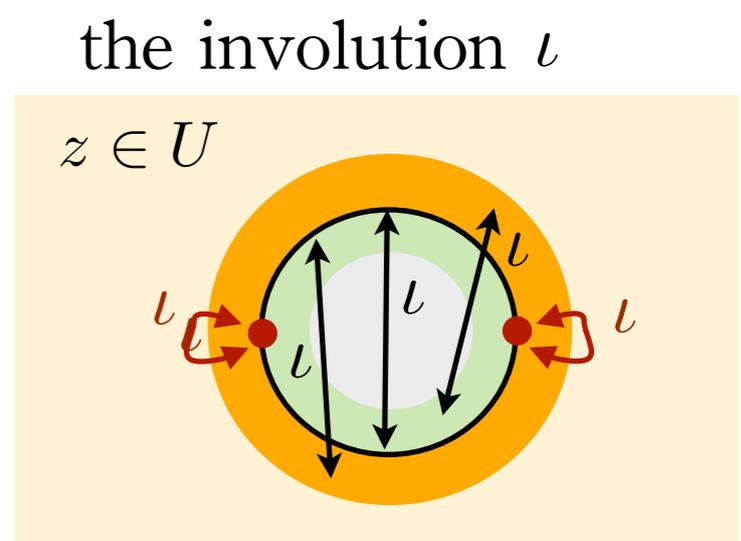

for maps with tubes GB, Eynard, Orantin (13)

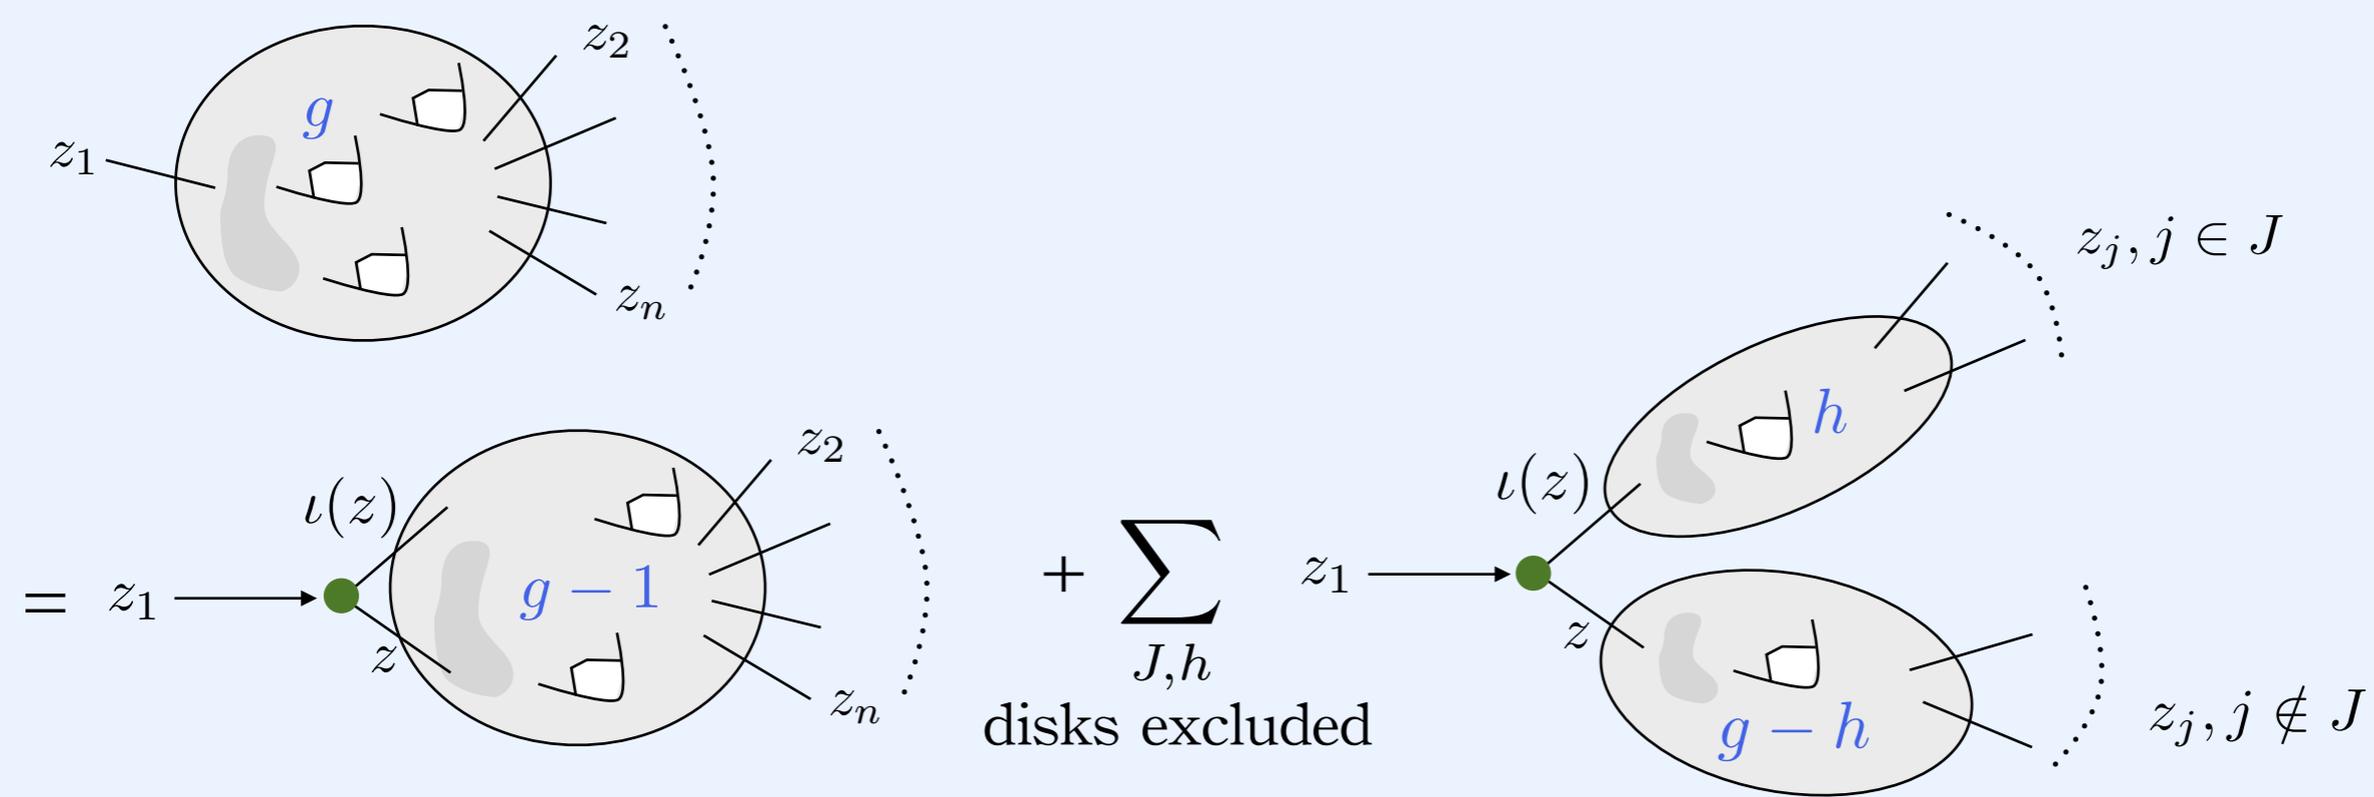

1. Maps with(out) tubes

Topological recursion

It can be computed by a recursion of topological nature.

$$\omega_n^g(z_1, \dots, z_n) = \text{Res}_{z \rightarrow \alpha, \beta} \frac{-\frac{1}{2} \int_{\iota(z)}^z \omega_2^0(\cdot, z_2)}{\omega_1^0(z) - \omega_1^0(\iota(z))} \dots = z_1 \rightarrow \begin{matrix} \iota(z) \\ \bullet \\ z \end{matrix} \dots$$

$$= z_1 \rightarrow \begin{matrix} \iota(z) \\ \bullet \\ z \end{matrix} \dots + \sum_{\substack{J, h \\ \text{disks excluded}}} z_1 \rightarrow \begin{matrix} \iota(z) \\ \bullet \\ z \end{matrix} \dots$$

1. Maps with(out) tubes

ω_n^g can be computed by a universal recursion of topological nature

if one knows $\omega_1^0 = \text{---} \text{---} \text{---}$ and $\omega_2^0 = \text{---} \text{---} \text{---}$

but the combinatorial interpretation of the recursion is not known ...

$$\omega_n^g(\iota(z), z_2, \dots, z_n) \quad ??$$

Definition

The topological recursion is the algorithm [Eynard, Orantin \(07\)](#)

$$\omega_1^0 = \text{---} \text{---} \text{---}$$

$$\omega_2^0 = \text{---} \text{---} \text{---}$$

initial data

$$\left(\omega_n^g = \text{---} \text{---} \text{---} \right)_{n, g \geq 0}$$

output

2 ... and formal matrix models

Relation to maps

Multidimensional integrals ...

... and their asymptotics

Generating series of maps can be represented by formal matrix integrals

Brézin, Itzykson, Parisi, Zuber (78)

if we introduce

the generating series of faces

$$D(x) = \frac{N}{t} \sum_k \frac{t_k}{k} x^k$$

the gaussian measure on
 $N \times N$ hermitian matrices

$$d\mu(M) = dM e^{-N \text{Tr} M^2 / 2t}$$

then, the formal series in t, t_k has a well-defined decomposition

$$\frac{\mu \left[e^{\text{Tr} D(M)} \prod_{i=1}^n \text{Tr} \frac{dx_i}{x_i - M} \right]_c}{\mu \left[e^{\text{Tr} D(M)} \right]} = \sum_{g \geq 0} N^{2-2g-n} W_n^g(x_1, \dots, x_n)$$

generating series of maps
of genus g with n rooted marked faces

Generating series of maps with tubes have a similar representation
 reformulation of Gaudin, Mehta, Kostov (90s)

if we introduce the generating series of faces

with topology of a disk
$$D(x) = \frac{N}{t} \sum_k \frac{t_k}{k} x^k$$

with topology of a cylinder
$$C(x, y) = \frac{\gamma}{t} \sum_{k_1, k_2} \frac{t_{k_1, k_2}}{2k_1 k_2} x^{k_1} y^{k_2}$$

then, the formal series in $t, t_k, \gamma, t_{k_1, k_2}$ has a well-defined decomposition

$$\frac{\mu \left[e^{\text{Tr} D(M) + \text{Tr} C(M \otimes \mathbf{1}_N, \mathbf{1}_N \otimes M)} \prod_{i=1}^n \text{Tr} \frac{dx_i}{x_i - M} \right]_c}{\mu \left[e^{\text{Tr} D(M) + \text{Tr} C(M \otimes \mathbf{1}_N, \mathbf{1}_N \otimes M)} \right]} = \sum_{g \geq 0} N^{2-2g-n} W_n^g(x_1, \dots, x_n)$$

generating series of maps with tubes
 of genus g with n rooted marked faces

$U(N)$ invariant measures :

the integrals over M reduces to an integral over its eigenvalues

e.g. the partition function

$$\begin{aligned} & \mu \left[e^{\text{Tr } D(M) + \text{Tr } C(M \otimes \mathbf{1}_N, \mathbf{1}_N \otimes M)} \right] \\ &= \frac{\text{Vol}(U(N))}{N!(2\pi)^N} \int_{\mathbb{R}^N} \prod_{i=1}^N d\lambda_i e^{-\frac{N\lambda_i^2}{2t} + D(\lambda_i) + C(\lambda_i, \lambda_i)} \prod_{1 \leq i < j \leq N} (\lambda_i - \lambda_j)^2 e^{2C(\lambda_i, \lambda_j)} \end{aligned}$$

arbitrary two-point interaction
vanishing like a square
at short distance

A summary on the large N expansion of $\int \prod_{i=1}^N d\lambda_i e^{-NV(\lambda_i)} \prod_{1 \leq i < j \leq N} (\lambda_i - \lambda_j)^2 K(\lambda_i, \lambda_j)$
 K non-vanishing

formal integral (\longrightarrow combinatorics, $1/N$ expansion, 1-cut lemma)

$K = 1$ Ambjørn, Makeenko, Chekhov, Kristjansen (90s), Eynard (04)

$K \neq 1$ GB, Eynard, Orantin (13)

3 Introduction to knots

Definition, classification

Knot invariants

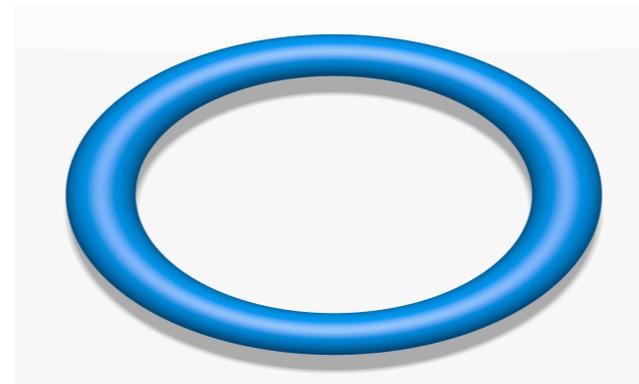

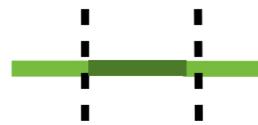

Asymptotics and why should we care ?

A **knot** is an isotopy class of proper embedding of a circle in S^3

Word in the braid group
 \leftrightarrow 2d projection of a knot

Tubular neighborhood
of a knot

Example

unknot

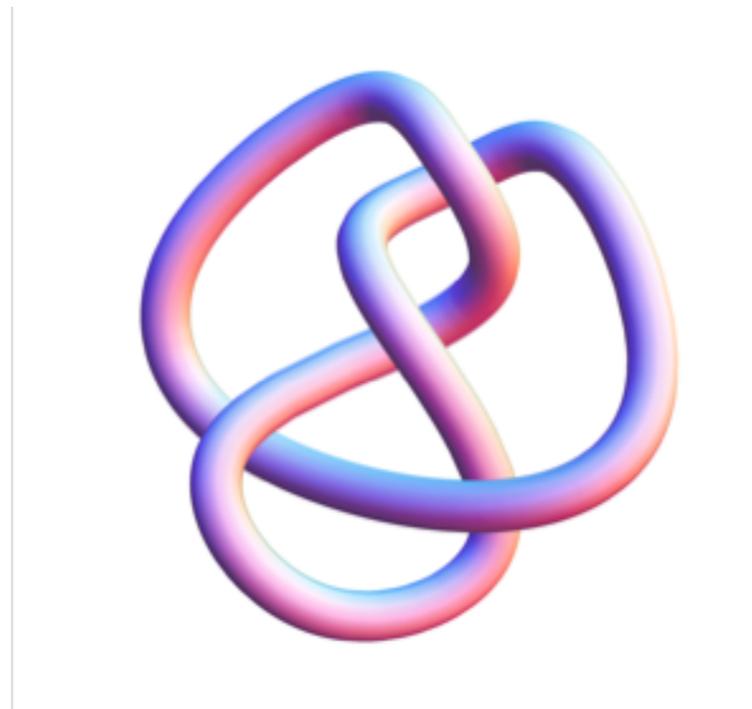

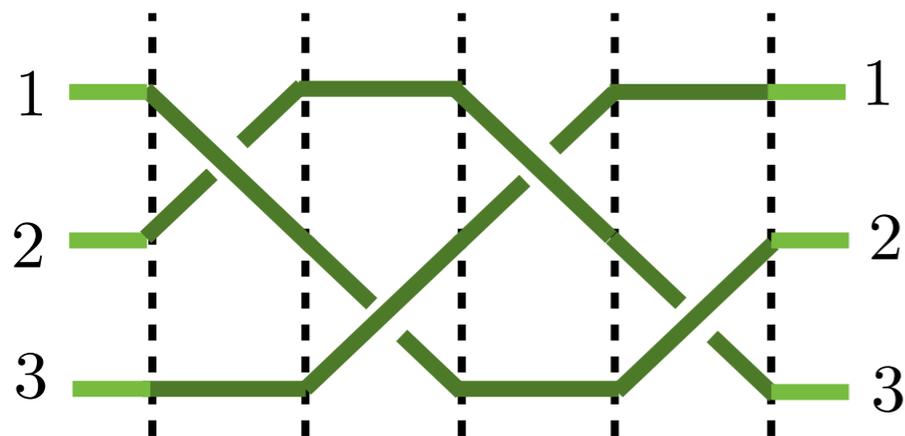

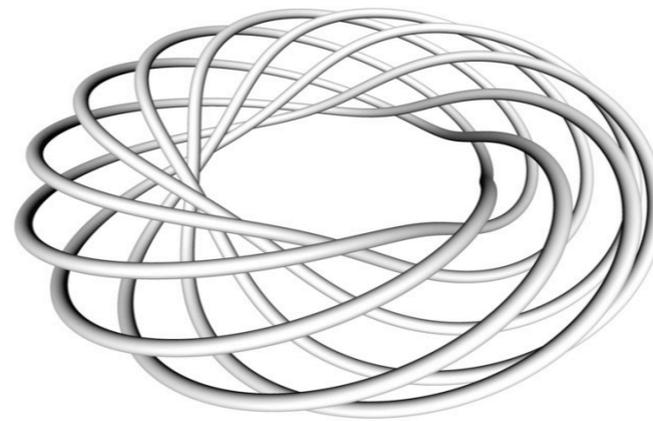

figure-eight
knot

Knots are complicated (as much as arithmetic in \mathbb{Z} is ...)

There exist infinitely many prime knots, which fall in 3 families

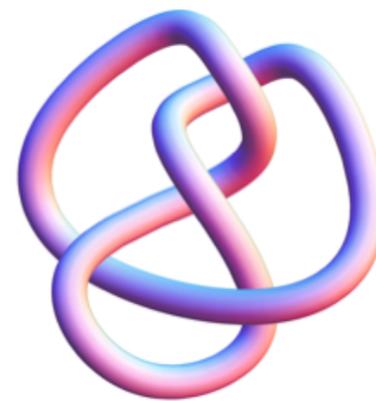

★ (P,Q) torus knots

★ hyperbolic knots

$S_3 \setminus K$

admits a complete hyperbolic metric

★ satellite knots
(uncharted territory)

Knots are complicated (as much as arithmetic in \mathbb{Z} is ...)

Hard algorithmic problems :

- ✱ unknotting number
- ✱ distinguishing two knots

→ construction of (computable) knot invariants to give partial answers

For any compact Lie group \mathbf{G} , irreducible representation \mathbf{R} ,
one can construct an invariant using representations of quantum groups

$$\mathbf{K} \longmapsto W_{\mathbf{K}}(\mathbf{G}, \mathbf{R}; q) \in \mathbb{Z}[q, q^{-1}]$$

knot colored HOMFLY polynomial

behaving nicely under geometric operations (gluings, cabling, ...)

For any compact Lie group \mathbf{G} , irreducible representation \mathbf{R} , one can construct an invariant using representations of quantum groups

$$\mathbf{K} \longmapsto W_{\mathbf{K}}(\mathbf{G}, \mathbf{R}; q) \in \mathbb{Z}[q, q^{-1}]$$

knot colored HOMFLY polynomial

behaving nicely under geometric operations (gluings, cabling, ...)

$$\mathbf{G} = \mathrm{SU}(2)$$

$$\mathbf{R} = \square$$

Jones polynomial

$$\mathbf{R} = \square \square \cdots \square$$

(m - 1) boxes

m-th colored Jones polynomial = $J_{\mathbf{K}, m}(q)$

$$J_m^{\text{unknot}}(q) = \frac{q^m - q^{-m}}{q - q^{-1}}$$

$$J_m^{\text{8-knot}}(q) = \frac{q^m - q^{-m}}{q - q^{-1}} \left(\sum_{k=0}^{m-1} (q^2)_k (1/q^2)_k \right)$$

but in general no closed formulas ...

Enumeration of knots by matrix model techniques
Zinn-Justin, Zuber

has nothing to do with the topic of this talk

For a given knot K

we would like to compute the asymptotic expansion of $W_K(G, R; q)$ when

$$* G = SU(N)$$

$$N \rightarrow \infty \quad q \rightarrow 1$$

$R =$ fixed Young tableau

$$t = N \ln(q) \text{ fixed}$$

(theory of LMO invariants)

$$* G = SU(2)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$R = \square \square \cdots \square$$

($m - 1$) boxes

$$u = m \ln(q) \text{ fixed}$$

For a given knot K

we would like to compute the asymptotic expansion of $W_K(G, R; q)$ when

$$\ast G = SU(N)$$

$$N \rightarrow \infty \quad q \rightarrow 1$$

$R =$ fixed Young tableau

$$t = N \ln(q) \text{ fixed}$$

(theory of LMO invariants)

4. Theorem : for torus knots, by the **topological recursion**

$$\ast G = SU(2)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$R = \square \square \cdots \square$$

($m - 1$) boxes

$$u = m \ln(q) \text{ fixed}$$

5. Conjecture : for hyperbolic knots, by the **topological recursion with nodes**

The interest about asymptotics of knot invariants started from

$$\ast \mathbf{G} = \mathbf{SU}(2)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$\mathbf{R} = \square \square \cdots \square$$

(m - 1) boxes

$$u = m \ln(q) \text{ fixed}$$

Volume conjecture

Kashaev (98), H. Murakami (00)

If K is a hyperbolic knot, $\lim_{m \rightarrow \infty} \frac{2\pi}{m} \ln |J_{\mathbf{K},m}(q = e^{2i\pi/m})| = \text{Volume}(\mathbb{S}_3 \setminus \mathbf{K})$

Algebraic
construction

Geometric
information

The interest about asymptotics of knot invariants started from

$$* \mathbf{G} = \mathbf{SU}(2)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$\mathbf{R} = \square \square \cdots \square$$

(m - 1) boxes

$$u = m \ln(q) \text{ fixed}$$

Volume conjecture

Kashaev (98), H. Murakami (00)

If K is a hyperbolic knot, $\lim_{m \rightarrow \infty} \frac{2\pi}{m} \ln |J_{\mathbf{K},m}(q = e^{2i\pi/m})| = \text{Volume}(\mathbb{S}_3 \setminus \mathbf{K})$

Other conjectures

other values of u and asymptotic expansion Gukov (04)
 arithmeticity, modularity, ... Zagier et al. (09)

Computation and unified understanding of those properties ?
 Relation to other fields (counting surfaces ...) ?

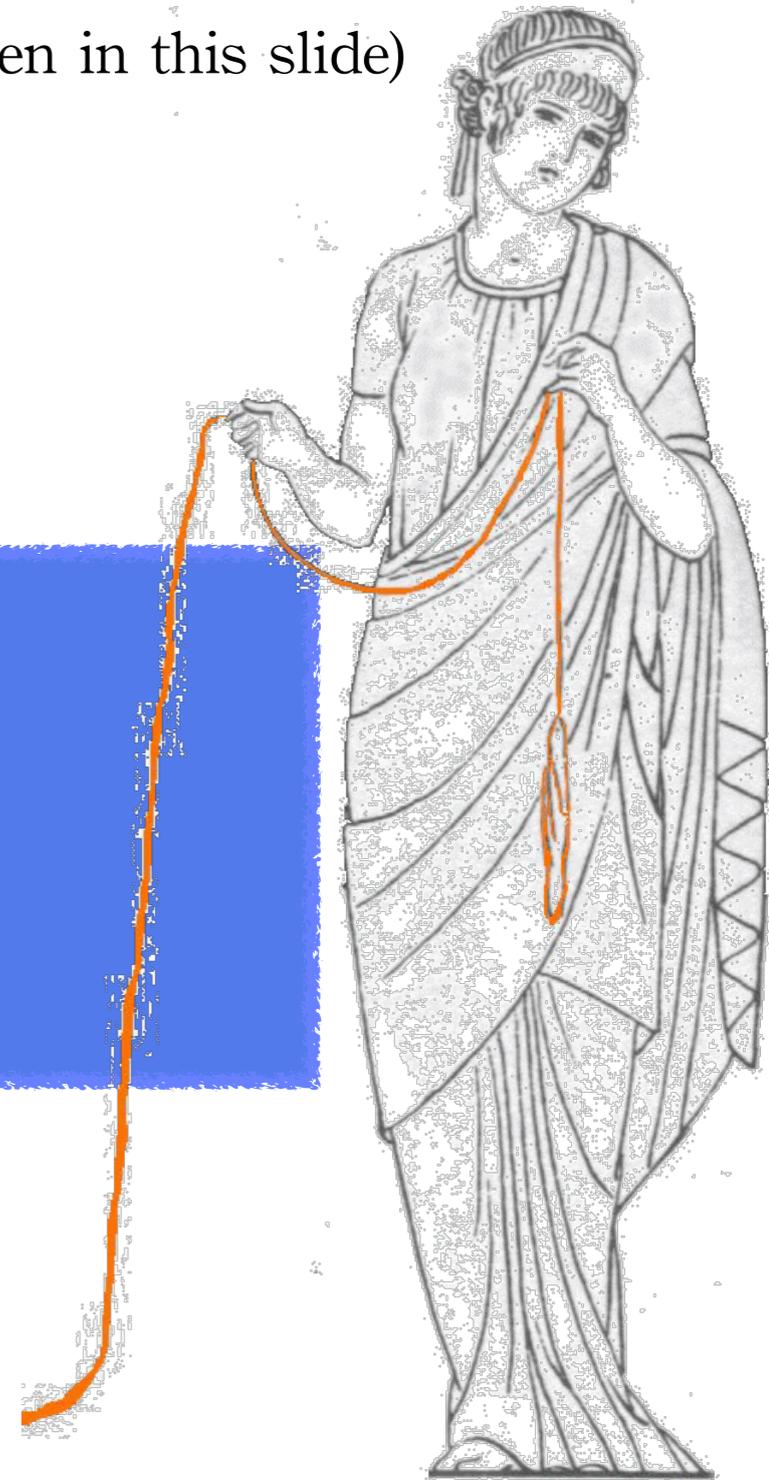

(There is a pun hidden in this slide)

4 Torus knots and $W(G, R)$

Definition, classification

Knot invariants

Asymptotics and why should we care ?

$W_K(\mathbf{G}, R; q)$

can be computed as an observable in Chern-Simons theory in S_3 **Witten (89)**

CS theory = quantum field theory with measure

$$d\mu_{\text{CS}}[\mathcal{A}] = D\mathcal{A} \exp \left\{ -\frac{1}{\ln q} \left(\mathcal{A} \wedge d\mathcal{A} + \frac{2}{3} \mathcal{A} \wedge \mathcal{A} \wedge \mathcal{A} \right) \right\}$$

\mathcal{A} = section of a \mathbf{G} principal bundle over S_3

Fact If \mathbf{C} is a loop in S_3

$\mu \left[\text{Tr}_R(\text{holonomy of } \mathcal{A} \text{ along } \mathbf{C}) \right]$ is a topological invariant

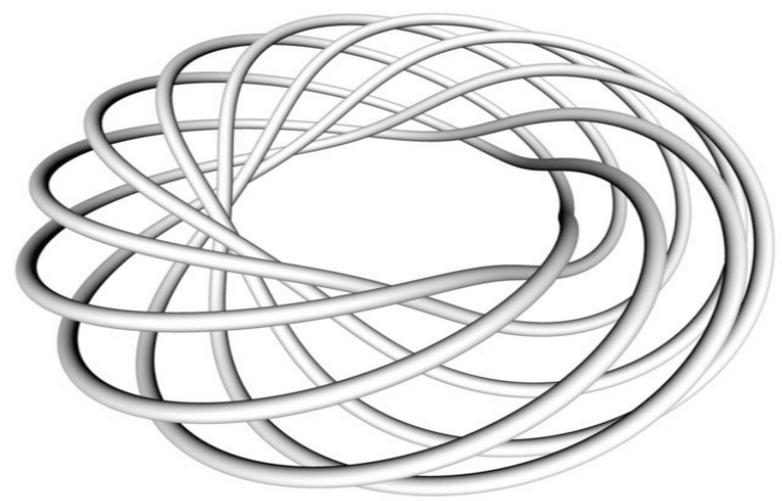

and coincides with $W_K(\mathbf{G}, R; q)$

For torus knots, the path integral reduces to a finite dimensional integral !
 (exact saddle point) Rozansky (98), Mariño (02), Beasley, Witten (07), Källen (09)

$$\mathbf{G} = \text{SU}(N)$$

$$t = N \ln(q)$$

$K =$

$$d\mu_N^{P,Q} = \prod_{i=1}^N d\lambda_i e^{-N\lambda_i^2/2PQt} \prod_{1 \leq i < j \leq N} (\lambda_i - \lambda_j)^2 K(\lambda_i, \lambda_j)$$

with
$$K(x, y) = \frac{\sinh\left(\frac{x-y}{2P}\right)}{\left(\frac{x-y}{2P}\right)} \frac{\sinh\left(\frac{x-y}{2Q}\right)}{\left(\frac{x-y}{2Q}\right)}$$

and the knot invariants are
$$W(\text{SU}(N), \mathbb{R}; q) = \frac{\mu_N^{P,Q} [\text{Schur}_{\mathbb{R}}(e^{\lambda_1}, \dots, e^{\lambda_N})]}{\mu_N^{P,Q} [1]}$$

$$d\mu_N^{P,Q} = \prod_{i=1}^N d\lambda_i e^{-N\lambda_i^2/2PQt} \prod_{1 \leq i < j \leq N} (\lambda_i - \lambda_j)^2 K(\lambda_i, \lambda_j)$$

with $K(x, y) = \frac{\sinh\left(\frac{x-y}{2P}\right)}{\left(\frac{x-y}{2P}\right)} \frac{\sinh\left(\frac{x-y}{2Q}\right)}{\left(\frac{x-y}{2Q}\right)}$

and the knot invariants are $W(\mathbf{SU}(N), \mathbb{R}; q) = \frac{\mu_N^{P,Q} [\text{Schur}_{\mathbb{R}}(e^{\lambda_1}, \dots, e^{\lambda_N})]}{\mu_N^{P,Q} [1]}$

It is convenient to use another basis of symmetric functions

Schur _{\mathbb{R}} \longleftrightarrow power sums

and form a generating series of expectation values of power sums

$$W_n(x_1, \dots, x_n) = \frac{\mu_N^{P,Q} \left[\prod_{i=1}^n \text{Tr} \frac{dx_i}{x_i - e^{M/PQ}} \right]_c}{\mu_N^{P,Q} [1]} \quad M = \text{diag}(e^{\lambda_1}, \dots, e^{\lambda_N})$$

$$d\mu_N^{P,Q} = \prod_{i=1}^N d\lambda_i e^{-N\lambda_i^2/2PQt} \prod_{1 \leq i < j \leq N} (\lambda_i - \lambda_j)^2 K(\lambda_i, \lambda_j)$$

with $K(x, y) = \frac{\sinh(\frac{x-y}{2P})}{(\frac{x-y}{2P})} \frac{\sinh(\frac{x-y}{2Q})}{(\frac{x-y}{2Q})}$

We would like to compute $W_n(x_1, \dots, x_n) = \frac{\mu_N^{P,Q} \left[\prod_{i=1}^n \text{Tr} \frac{dx_i}{x_i - e^{M/PQ}} \right]_c}{\mu_N^{P,Q} [1]}$

Theorem

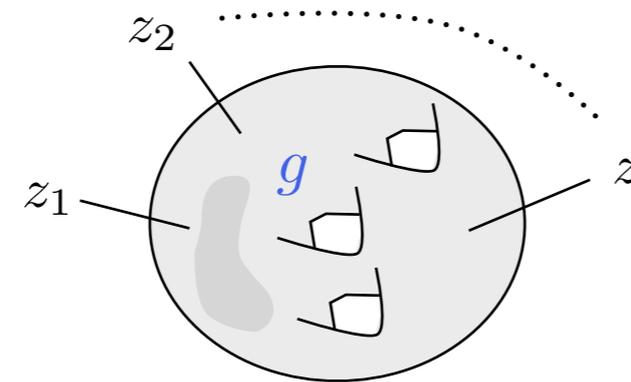

prediction, check : Brini, Eynard, Mariño (11)
 proof : GB, Eynard, Orantin (13)

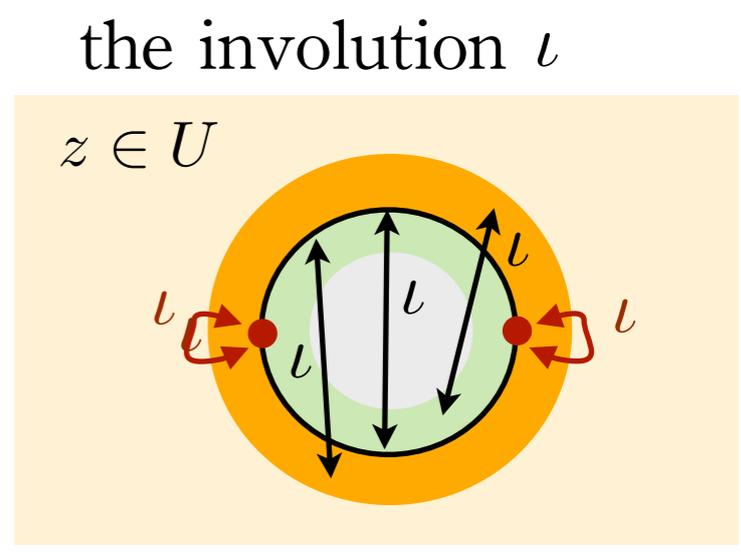

Assume $t = N \ln q > 0$ fixed

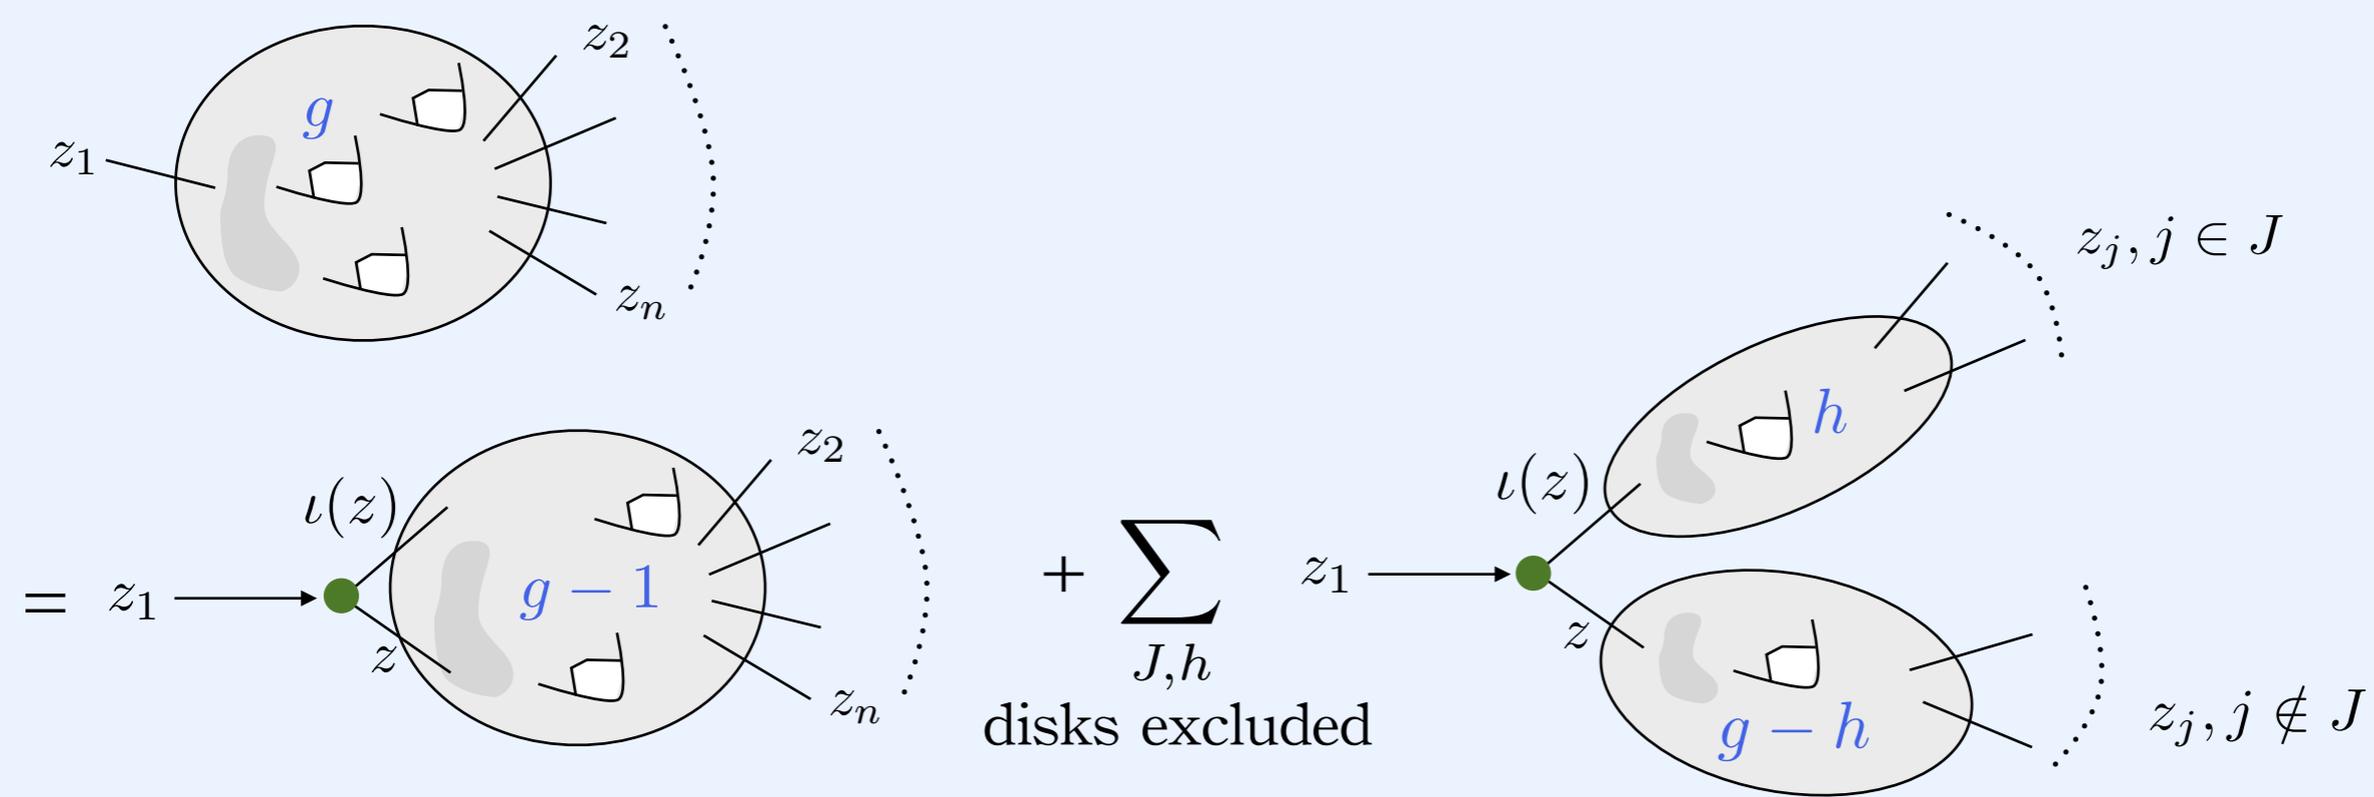

- ★ There is a large N expansion $W_n = \sum_{g \geq 0} N^{2-2g-n} W_n^g$
- ★ There is an explicit formula for W_1^0 and W_2^0
- ★ W_n^g have 1-cut $[a, b]$, and are computed by the topological recursion

Reminder: topological recursion

It can be computed by a recursion of topological nature.

$$\omega_n^g(z_1, \dots, z_n) = \text{Res}_{z \rightarrow \alpha, \beta} \frac{-\frac{1}{2} \int_{\iota(z)}^z \omega_2^0(\cdot, z_2)}{\omega_1^0(z) - \omega_1^0(\iota(z))} \dots = z_1 \rightarrow \begin{matrix} \bullet \\ \swarrow \iota(z) \\ \searrow z \end{matrix} \dots$$

$$= z_1 \rightarrow \begin{matrix} \bullet \\ \swarrow \iota(z) \\ \searrow z \end{matrix} \dots + \sum_{J, h} \text{disks excluded} \quad z_1 \rightarrow \begin{matrix} \bullet \\ \swarrow \iota(z) \\ \searrow z \end{matrix} \dots$$

$$d\mu_N^{P,Q} = \prod_{i=1}^N d\lambda_i e^{-N\lambda_i^2/2PQt} \prod_{1 \leq i < j \leq N} (\lambda_i - \lambda_j)^2 K(\lambda_i, \lambda_j)$$

$$\text{with } K(x, y) = \frac{\sinh\left(\frac{x-y}{2P}\right)}{\left(\frac{x-y}{2P}\right)} \frac{\sinh\left(\frac{x-y}{2Q}\right)}{\left(\frac{x-y}{2Q}\right)}$$

$$\text{We would like to compute } W_n(x_1, \dots, x_n) = \frac{\mu_N^{P,Q} \left[\prod_{i=1}^n \text{Tr} \frac{dx_i}{x_i - e^{M/PQ}} \right]_c}{\mu_N^{P,Q} [1]}$$

- ★ This model is a special case of the matrix model enumerating maps with tubes

any explanation ??

- ★ Cannot be generalized yet to hyperbolic knots ...
(no finite-dimensional reduction of CS theory)

§ Hyperbolic knots and $W(\mathfrak{g}, R)$

Definition, classification

Knot invariants

Asymptotics and why should we care ?

The interest about asymptotics of knot invariants started from

$$* G = \mathrm{SU}(2)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$\mathcal{R} = \square \square \cdots \square$$

(m - 1) boxes

$$u = m \ln(q) \text{ fixed}$$

Volume conjecture

Kashaev (98), H. Murakami (00)

If K is a hyperbolic knot, $\lim_{m \rightarrow \infty} \frac{2\pi}{m} \ln |J_{K,m}(q = e^{2i\pi/m})| = \mathrm{Volume}(\mathbb{S}_3 \setminus K)$

The interest about asymptotics of knot invariants started from

$$* \mathbf{G} = \mathrm{SU}(2)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$\mathcal{R} = \square \square \cdots \square$$

(m - 1) boxes

$$u = m \ln(q) \quad \text{fixed}$$

Generalized ...

Gukov (04)

If K is a hyperbolic knot,

$$J_{\mathbf{K}, m}(q) = (\ln q)^{\Delta/2} \exp \left(\sum_{k \geq -1} (\ln q)^k S_k(u) + o(\ln q)^\infty \right)$$

$$\text{with } \frac{1}{2\pi} \mathrm{Re}[u S_{-1}(u)] = \mathrm{Volume}_u(\mathbb{S}_3 \setminus \mathbf{K})$$

There are several methods to compute $S_k(u)$

I will present a conjectural one involving topological recursion

Topological recursion :

$$\omega_1^0 = \text{[Diagram: Circle with shaded blob and one external line]}$$

$$\omega_2^0 = \text{[Diagram: Circle with shaded blob and two external lines]}$$

initial data

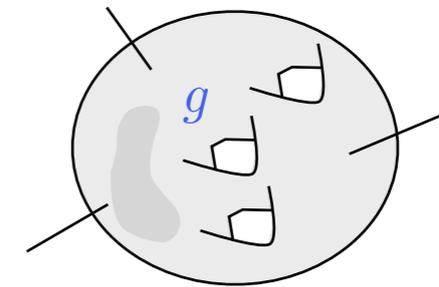

$$\left(\omega_n^g = \text{[Diagram: Circle with shaded blob, g handles, and n external lines]} \right)_{n, g \geq 0}$$

output

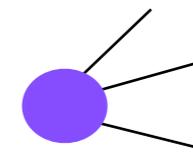

Definition

A **graph with nodes** is a abstract graph with external legs

- * vertices of type 1 are n -valent ($n \geq 1$)
 carry an integer label g
 with $\chi = 2g - 2 + n > 0$

vertices of type 2 (**nodes**)

- * edges : type 1 — type 2
 external legs : type 1 —

Example

An example of a graph with nodes. It shows three purple nodes (type 2) connected to three vertices of type 1. The vertices have genus labels 'g' and 'b'. The connections are as follows: the top node connects to the top and middle vertices; the middle node connects to the middle and bottom vertices; the bottom node connects to the bottom vertex.

Choose a spectral curve and an initial data

$$\omega_1^0(z) = z \cdot \text{[disk with shaded region]}$$

$$\omega_2^0(z_1, z_2) = z_1 \cdot \text{[disk with shaded region and two external legs labeled } z_1, z_2 \text{]}$$

topological recursion \longrightarrow

$$\omega_n^g(z_1, \dots, z_n) = \text{[disk with shaded region, genus } g \text{, and } n \text{ external legs labeled } z_1, \dots, z_n \text{]}$$

Choose a path Γ
Choose a cycle \mathcal{B} on the spectral curve

Choose numbers $(\rho_n)_n$

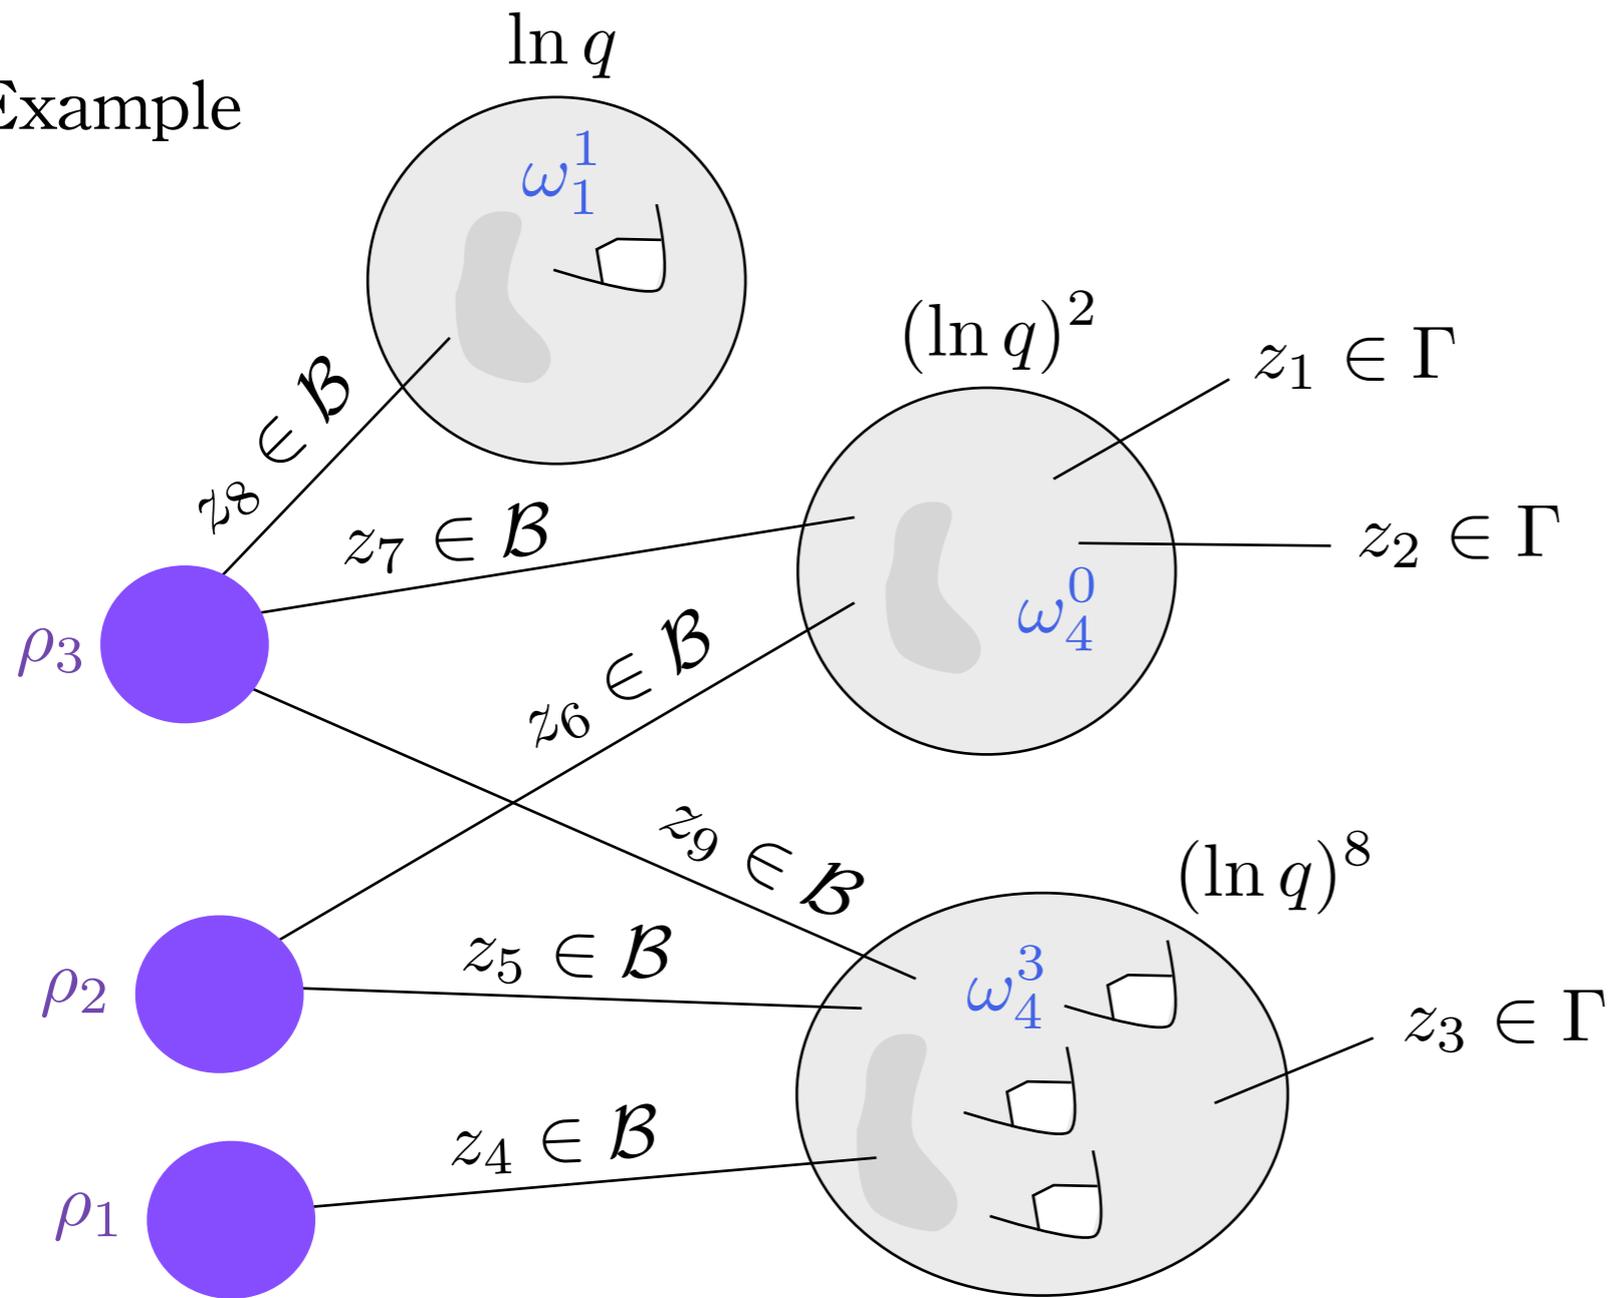

We assign the following weight to a graph with nodes

- ✱ assigning a variable z to each edge
- ✱ local weight for a n -valent vertex of type 1 $(\ln q)^{2g-2+n}$
- ✱ local weight for a n -valent vertex of type 2 ρ_n
- ✱ for external legs, integrate $z \in \Gamma$
- ✱ for edges, integrate $z \in \mathcal{B}$
- ✱ include the symmetry factor

$$(\ln q)^{2g-2+n} \cdot \text{[disk with shaded region, genus } g \text{, and } n \text{ external legs labeled } z_1, \dots, z_n \text{]}$$

$$\rho_n \cdot \text{[disk with shaded region, genus } g \text{, and } n \text{ external legs labeled } z_1, \dots, z_n \text{]}$$

Example

$$\text{weight} = (\ln q)^{11} \rho_1 \rho_2 \rho_3 \left(\int_{\mathcal{B}} \omega_1^1 \right) \left(\frac{1}{4} \int_{\mathcal{B}} \int_{\mathcal{B}} \int_{\Gamma} \int_{\Gamma} \omega_4^0 \right) \left(\frac{1}{6} \int_{\mathcal{B}} \int_{\mathcal{B}} \int_{\mathcal{B}} \int_{\Gamma} \omega_4^3 \right)$$

We define the **wave function** as a generating series in $\ln q$

$$\psi(\ln q; \omega_1^0, \omega_2^0, \Gamma, \mathcal{B}, (\rho_n)_n)$$

$$= \exp \left\{ \frac{1}{\ln q} \int_{\Gamma} \omega_1^0 + \frac{1}{2} \int_{\Gamma} \int_{\Gamma} \omega_2^0 + \sum \text{weight} \left(\begin{array}{c} \text{connected graphs} \\ \text{with nodes} \end{array} \right) \right\}$$

$$= \exp \left\{ \begin{array}{l} \frac{1}{\ln q} \text{ (circle with blob)} + \frac{1}{2} \text{ (circle with blob)} \\ (\ln q) \left(\frac{1}{6} \text{ (circle with blob and 3 lines)} + \frac{1}{2} \text{ (circle with blob and 1 blue node)} + \frac{1}{2} \text{ (circle with blob and 2 blue nodes)} + \frac{1}{6} \text{ (circle with blob and 3 blue nodes)} + \text{ (circle with blob and square)} \right) \\ + O(\ln q)^2 \end{array} \right\}$$

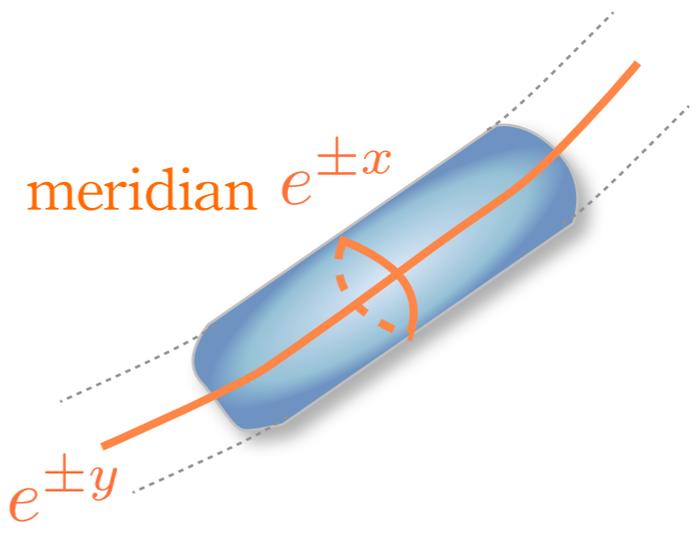

Topological recursion with nodes

To any knot \mathbf{K} , one can associate a spectral curve

$$\begin{aligned} \mathcal{C}_{\mathbf{K}} &= \{ \text{SL}_2(\mathbb{C}) \text{ representations of } \pi_1(\mathbb{S}^3 \setminus \mathbf{K}) \} \\ &\simeq \{ (x, y) \in \mathbb{C}^2, \quad A_{\mathbf{K}}(e^x, e^y) = 0 \} \end{aligned}$$

$A_{\mathbf{K}} \in \mathbb{Z}[X, Y]$ is the **A-polynomial** of \mathbf{K}

Cooper, Culler, Gillet, Long, Shalen (94)

We choose the initial data

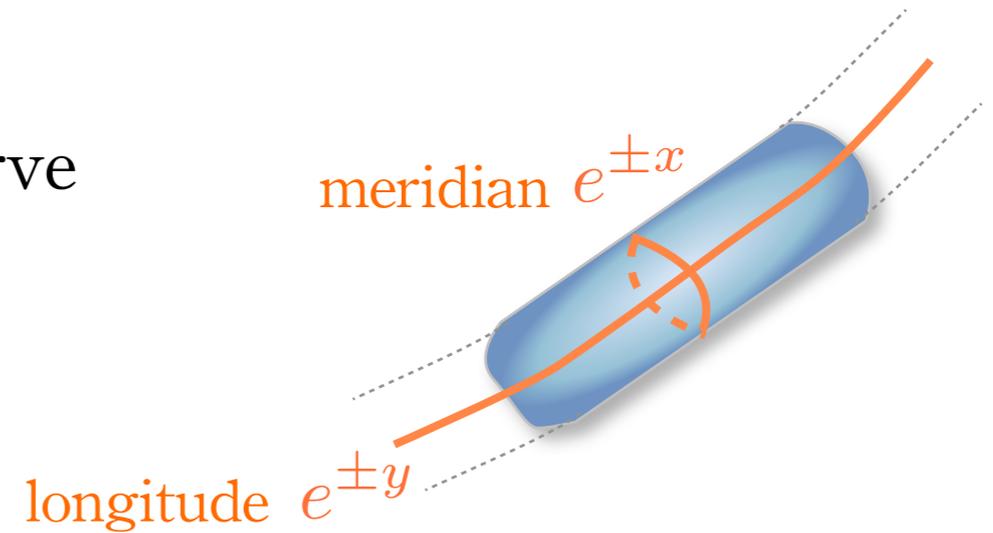

$$\omega_1^0(z) = \int_{\gamma} y(z) dx(z) = y(z) dx(z)$$

$$\omega_2^0(z_1, z_2) = \int_{\gamma} d_{z_1} d_{z_2} (\text{Green function}(z_1, z_2) \text{ on } \mathcal{C})$$

To any knot \mathbf{K} , one can associate a spectral curve

$$\mathcal{C}_{\mathbf{K}} = \{(x, y) \in \mathbb{C}^2, \quad A_{\mathbf{K}}(e^x, e^y) = 0\}$$

$A_{\mathbf{K}} \in \mathbb{Z}[X, Y]$ is the **A-polynomial** of \mathbf{K}

$$\omega_1^0(z) = \int_{\gamma} y(z) dx(z)$$

$$\omega_2^0(z_1, z_2) = \int_{\gamma} d_{z_1} d_{z_2} (\text{Green function}(z_1, z_2) \text{ on } \mathcal{C}_{\mathbf{K}})$$

We choose a path so that $\int_{\Gamma(u)} = \int^{x=u} + \int^{x=-u}$

Conjecture

Dijkgraaf, Fuji, Manabe (09), corrected by GB, Eynard (12)

For suitable \mathcal{B} and node weights $(\rho_n)_n$

$$(J_{m, \mathbf{K}}(q))^2 \sim \psi(\ln q; \omega_1^0, \omega_2^0, \Gamma(u), \mathcal{B}, (\rho_n)_n)$$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$u = m \ln(q) \text{ fixed}$$

Conjecture

Dijkgraaf, Fuji, Manabe (09), corrected by B., Eynard (12)

For suitable \mathcal{B} and node weights $(\rho_n)_n$

$$m \rightarrow \infty \quad q \rightarrow 1$$

$$(J_{m, \mathbf{K}}(q))^2 \sim \psi(\ln q; \omega_1^0, \omega_2^0, \Gamma(u), \mathcal{B}, (\rho_n)_n)$$

$$u = m \ln(q) \text{ fixed}$$

$$= \exp \left\{ \begin{array}{l} \frac{1}{\ln q} \text{ (circle with shaded blob)} + \frac{1}{2} \text{ (circle with shaded blob)} \\ (\ln q) \left(\frac{1}{6} \text{ (circle with shaded blob)} + \frac{1}{2} \text{ (circle with shaded blob and purple dot)} + \frac{1}{2} \text{ (circle with shaded blob and purple dot)} + \frac{1}{6} \text{ (circle with shaded blob and purple dot)} + \text{ (circle with shaded blob)} \right) \\ + O(\ln q)^2 \end{array} \right\}$$

★ In agreement with the volume conjecture since it is known that

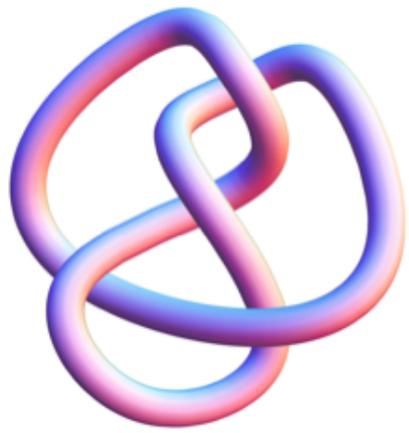

$$\frac{1}{\ln q} \text{ (circle with shaded blob)} = \frac{1}{\ln q} \left(\int_{x=-u}^{x=u} + \int_{x=-u}^{x=u} y dx \right) = \frac{m}{2\pi} \text{Volume}_u(\mathbb{S}_3 \setminus \mathbf{K})$$

Neumann, Zagier (85)
Yoshida (85)

★ $\text{genus}(\mathcal{C}) > 0$ for hyperbolic knots \longrightarrow nodes are necessary

5. Hyperbolic knots and $W(G, \mathbb{R})$

Example : 8-knot

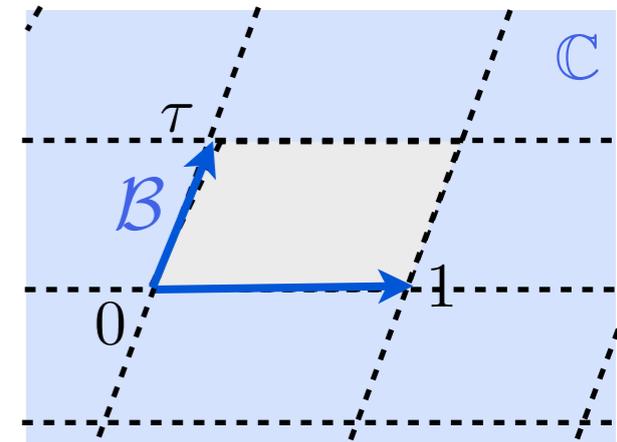

$$A(X, Y) = Y^2 X^4 + Y(-X^8 + X^6 + 2X^4 + X^2 - 1)Y + X^4$$

$$X = e^x, Y = e^y$$

The curve $A(e^x, e^y) = 0$

is \simeq to an elliptic curve $\mathbb{C}/(\mathbb{Z} + \tau\mathbb{Z})$

Here is the recipe for the node weights ...

Consider the 3 Jacobi theta series in

$$\begin{cases} \vartheta_2(Q) & = \sum_{k \in \mathbb{Z}} (-1)^k Q^{k^2/2} \\ \vartheta_3(Q) & = \sum_{k \in \mathbb{Z}} Q^{k^2/2} \\ \vartheta_4(Q) & = \sum_{k \in \mathbb{Z}} Q^{(k+1/2)^2/2} \end{cases}$$

It is known that $\frac{(-8\pi^2 Q \partial_Q)^\ell \vartheta_\bullet}{\vartheta_\bullet} = P_\ell(\vartheta_2^4(Q), \vartheta_3^4(Q), E_2(Q))$ where P_ℓ is a polynomial

Let us compute $P_\ell(\vartheta_2^4(Q), \vartheta_3^4(Q), 0)$ for $Q = e^{2i\pi\tau}$

(= algebraic numbers because A has \mathbb{Z} -coefficients)

5. Hyperbolic knots and $W(G, \mathbb{R})$

Example : 8-knot

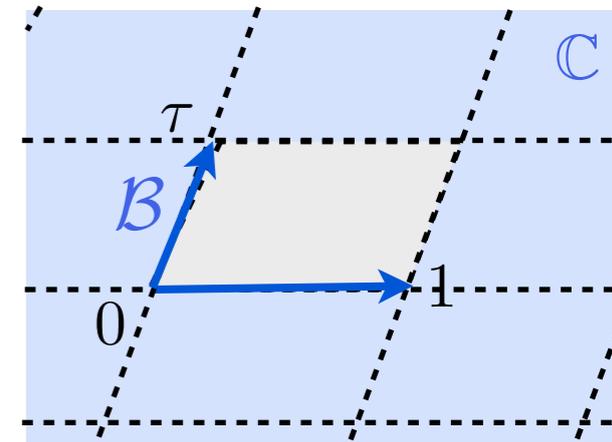

$$A(X, Y) = Y^2 X^4 + Y(-X^8 + X^6 + 2X^4 + X^2 - 1)Y + X^4$$

$$X = e^x, Y = e^y$$

The curve $A(e^x, e^y) = 0$

is \simeq to an elliptic curve $\mathbb{C}/(\mathbb{Z} + \tau\mathbb{Z})$

Here is the recipe for the node weights ...

$$\tilde{\rho}_n = \sum_{(J_i)_i \text{ partition of } n} \prod_i \rho_{|J_i|} \quad \text{and} \quad \tilde{\rho}_{2n} = \frac{(-8\pi^2 Q \partial_Q)^n \vartheta_\bullet}{\vartheta_\bullet} (Q = e^{2i\pi\tau}) \Big|_{E_2 \equiv 0}$$

$$\tilde{\rho}_{2n+1} = 0$$

$$D = -8\pi^2 Q \partial_Q \quad j = 2, 3, 4 \text{ up to permutation}$$

$D\vartheta_j/\vartheta_j _{E_2 \equiv 0}$	$\frac{-7+3i\sqrt{15}}{24}$	$\frac{-7-3i\sqrt{15}}{24}$	$\frac{7}{12}$
$D^2\vartheta_j/\vartheta_j _{E_2 \equiv 0}$	$\frac{47+21i\sqrt{15}}{96}$	$\frac{47-21i\sqrt{15}}{96}$	$-\frac{47}{48}$
$D^3\vartheta_j/\vartheta_j _{E_2 \equiv 0}$	$\frac{-665+9i\sqrt{15}}{1152}$	$\frac{-665-9i\sqrt{15}}{1152}$	$-\frac{301}{576}$

$$\rho_{2n+1} = 0$$

$$\rho_2 = \frac{7}{12}$$

$$\rho_4 = -2$$

$$\rho_6 = -\frac{511}{576}$$

...

$\tilde{\rho}_{2n}$

Asymptotics of the colored Jones polynomial

$$J_{\mathbf{K},m}(q) = (\ln q)^{\Delta/2} \exp \left(\sum_{k \geq -1} (\ln q)^k S_k(u) + o(\ln q)^\infty \right)$$

For the 8-knot, we predict from topological recursion with nodes

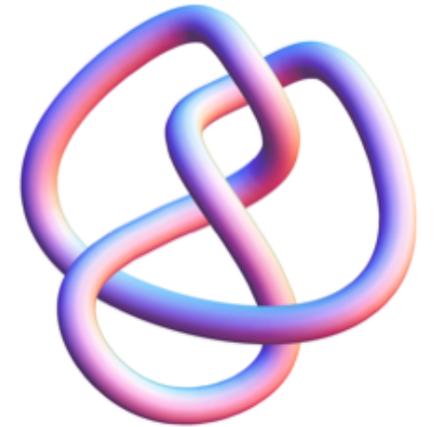

$$S_1(u) = -\frac{1}{24 \sigma^{3/2}(e^u)} (e^{12u} - e^{10u} - 2e^{8u} + 15e^{6u} - 2e^{4u} - e^{2u} + 1)$$

$$S_2(u) = \frac{1}{\sigma^3(e^u)} (e^{12u} - e^{10u} - 2e^{8u} + 5e^{6u} - 2e^{4u} - e^{2u} + 1)$$

$$S_3(u) = \frac{e^{4u}}{180 \sigma^{9/2}(e^u)} \begin{pmatrix} e^{32u} - 4e^{30u} - 128e^{28u} + 36e^{26u} + 1074e^{24u} - 5630e^{22u} \\ + 5782e^{20u} + 7484e^{18u} - 18311e^{16u} + 7484e^{14u} + 5782e^{12u} \\ + 1074e^{8u} + 36e^{6u} - 128e^{4u} - 4e^{2u} + 1 \end{pmatrix}$$

where $\sigma(X) = X^8 - 2X^6 - X^4 - 2X^2 + 1$

in agreement with earlier predictions of [Dimofte, Gukov, Lenells, Zagier \(09\)](#)

Conclusion

The same topological recursion allows to compute

generating series of maps with tubes of any topology ← Tutte eqns.

asymptotic expansion in matrix models ← Schwinger-Dyson eqns.

asymptotic expansion of knot invariants ← ???

* $G = SU(N)$

$$N \rightarrow \infty \quad q \rightarrow 1$$

torus knots

$R =$ fixed Young tableau

$$t = N \ln(q) \text{ fixed}$$

* $G = SU(2)$

$$m \rightarrow \infty \quad q \rightarrow 1$$

hyperbolic knots

$$R = \begin{array}{|c|c|} \hline \square & \square \\ \hline \end{array} \quad \square$$

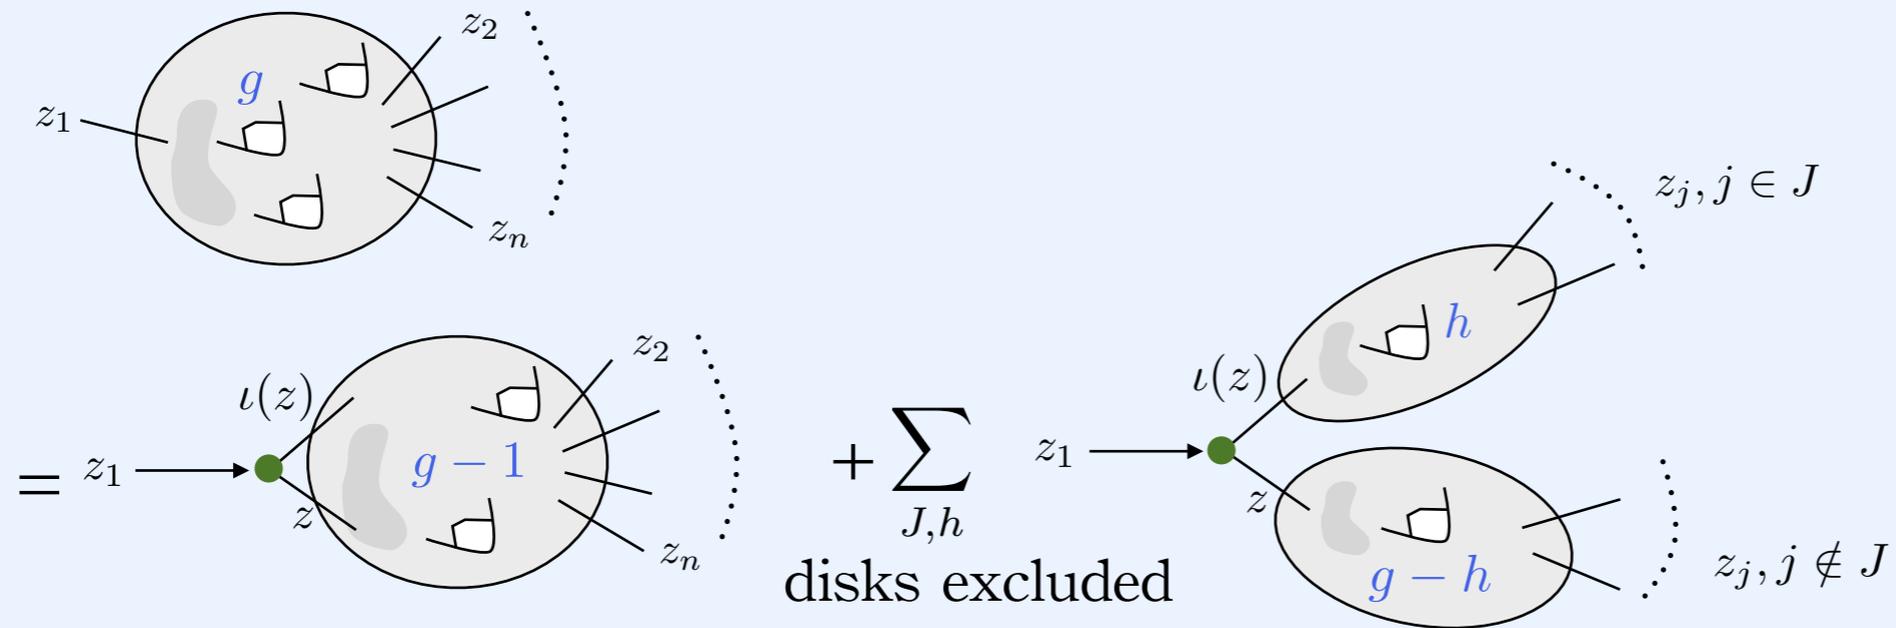

(m - 1) boxes

$$u = m \ln(q) \text{ fixed}$$

There should be a unifying picture ...

2 questions for combinatorists

- ★ Bijection between maps behind the topological recursion ?

- ★ For maps, what would a topological recursion **with nodes** count ?
